**?** My machine is a 1915 2½ h.p. New Imperial two-speed. I took the engine down, cleaned off the carbon behind the rings, and also ground in the valves. I fitted new inlet valve guide and valve, as the old ones were badly worn, and put the engine up again. Trouble. After starting I can open the throttle fully (by degrees, of course), but when the engine is hot I cannot open the throttle a quarter, if I do the engine either stops altogether, with perhaps only two explosions, or stops without a single fire, just as if I had applied a magneto cut-out—a fitting I do not possess. I will, for your guidance, enumerate below a few things which I do not think can cause this, as I have already attended to them. Valve clearances quite in order. Petrol getting to carburetter all right. Have tried different levels—no result. The new valve is a very loose fit in the new guide. Cannot be magneto, or how is it I can do well over 40 m.p.h. before the engine heats up? I have had the engine down again, ground in valves. The baffling part of the mystery is that the trouble only manifests itself when the engine is at normal running heat, and it will run indefinitely and perfectly without a single miss on the restricted throttle opening.—W.H.W.

It is possible that your trouble is due to faults in either the plug or carburetter. If the compression is good and the valves are not sticking the spark and carburation are the only other points which can possibly cause the trouble. If the trouble is ignition, it points more to the plug being faulty and unable to withstand the extra heat and pressure of the further

opening of the throttle. You should also make sure there are no stoppages in the carburetter. A slightly choked jet might cause the trouble, water, or some foreign matter floating in the petrol which gets drawn up into the jet and then falls back again. Make sure there are no air leaks. Bind all doubtful points with adhesive tape. Really the only satisfactory way of finding out is to go over each item systematically, beginning with the plug and carburetter. You should also make certain that, in cleaning your carburetter, you have not enlarged the jet at all.

**READER'S REPLY.****Slow Running.**

Re query of "M.R.S." in *The Motor Cycle* of January 20th regarding slow running of the 1915 5 h.p. twin Indian. If "M.R.S." makes sure that he has no air leaks around the joint between the inlet valve cages and domes and at manifold nuts he should not have any trouble, and if he retards the spark slightly he should be able to get slow running. A smaller pilot jet would not help him much, as the size fitted is only found after experiment and trial by the test department.—W. J. EDWARDS, Springfield, Mass.

**EXPERIENCES WANTED.**

"W.W." (Edinburgh).—Binks' fuel.  
 "E.C." (Portsmouth).—F.N. 5 h.p. 1915, also Zenith 5-6 h.p. 1913. Petrol consumption, solo and sidecar.  
 "S.T.B." (Sussex).—2½ h.p. T.D.C. de Luxe. Consumption, speed, hill-climbing capabilities with fixed gear, and reliability.  
 "J.J.M." (Castlehayney).—1915 4 h.p. A.J.S. and 3½ h.p. Sunbeam for sidecar work. Reliability, consumption, speed, and cost of upkeep.

**RECOMMENDED ROUTES.**

**ISLE OF GRAIN TO BERKELEY.**—C.H.B.  
 Isle of Grain, Rochester, Leybourne, Wrotham Heath, Ightham, Riverhead, Westerham, Redhill, Dorking, Guildford, Odiham, Hook, Basingstoke, Kingsclere, Newbury, Hungerford, Marlborough, Broad Hinton, Wootton Bassett, Malmesbury, Tetbury, Dursley, Berkeley. Approximately 160 miles.

**LIVERPOOL TO CANTERBURY, VIA ST. ALBANS.**—G.H.

Liverpool, ferry to Birkenhead, Sutton, Chester, Broxtown, Whitchurch, Ternhill, Newport, Woodcote, Weston-under-Lizard, Gailey, Four Crosses, Brownhills Common, Muckley Corner, Fazeley, Atherstone, High Cross, Kilsby, Daventry, Towcester, Dunstable, St. Albans, Hatfield, Hertingfordbury, Hertford, Hoddesdon, Waltham Cross, Wake Arms, Epping, Chipping Ongar, Brentwood, Ingrave, Orsett, Tilbury, ferry to Gravesend, Rochester, Chatham, Sittingbourne, Canterbury—approximately 290 miles.

**PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.**

In view of the decision of the Government to limit the import of material for the manufacture of paper it is imperative that every possible step should be taken to avoid waste of paper in any form. It has been the custom in the past for newsagents to order a certain number of papers for chance sales, and these copies if unsold become what are known as "returns"; in other words, waste copies.

In the case of "THE MOTOR CYCLE" the percentage of returned unsold copies has been remarkably low, but in order to conserve the supply of paper in future it is desirable that the waste of copies, ordered to accommodate occasional purchasers, shall as far as possible be eliminated.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in this matter by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

MOTOR CYCLES FOR SALE.

Bat.

- BAT-J.A.P., 5hp., Mabon clutch, spring frame; bargain, £12.—Earl, 5, Heath St., Hampstead. [X4277]

GODFREY'S  
STANDARD  
OF SATISFACTION

IS TO BE FRIENDS WITH EACH INDIVIDUAL CUSTOMER AT THE END OF A SEASON'S RUN.

If we fail in this practical test, we are just as anxious as the customer to know the reason why, and to do anything and everything to give him complete satisfaction. Because—no question of gain is ever worth considering if it involves the loss of a customer's faith in the agent. This is the reason why Godfrey's have a name for straight dealing.

1913 3½-h.p. L.M.C., variable gear; a good deal, £27; guaranteed, easy payments arranged.—Jones, Garage, Muswell Hill, N. [2242]

## Lugton.

LUXTON, 1914, Bosch waterproof, Druids, N.S.U. 2-speed; £20.—39, Belmont Park Rd., Leyton. [2207]

## Martin.

MARTIN-J.A.P., 1914, T.T., 8-10-h.p., J.A.P. engine, overhead valves, 2-speed countershaft gear and clutch, splendid order; £45.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0552]

## MOTOR CYCLES FOR SALE.

## Martin.

MARTIN-J.A.P., latest 1916 models, delivery from stock; single gear £32/10, if fitted with the famous Enfield 2-speed countershaft gear £37/10.—Sole London and District Agents Cars and Motor Sundries, Ltd., 175-177, Shaftesbury Ave., W.C. Tel.; Regent 1432. [0760]

## Matchless

MATCHLESS Combination, 1914, 3½ h.p. twin, 3 speeds, kick starter; £40 to clear.—Percy and Co., 337, Euston Rd., London. [2232]

1913½, 3½ h.p. Matchless T.T. Twin, overhead valves, 3-speed, kick start, in fine order; £31, no offers.—J. W. Fortnum, Middlewich. [1907]

1913 7½ h.p. Matchless, Canoelet sidecar, all accessories; £55, cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea, London, Cardiff. [0721]

1915 Matchless 8B. Combination, perfect condition, speedometer, lamps, horn, spares; accept £78, or near offer.—Dymond, 1, Windsor Terrace, Newcastle-on-Tyne. [X4086]

8 h.p. Matchless, model B, J.A.P. engine, horn, lamps, Cowey speedometer, all spares, perfect condition, just overhauled by makers, with sidecar; £45, or separately; cost £407.—1, De Freville Av., Cambridge. [X4185]

1914 (May) Matchless 8B. Combination, Lucas set, Cowey speedometer, entirely overhauled, re-enamelled throughout as new, not used nearly 12 months; owner active service; accept £73.—Willways, Ltd., Bristol. [X4129]

MATCHLESS, 8 h.p., countershaft, all-chain drive, 17 gn. sidecar, F.R.S. 78/6 lamp set, sidecar lamp, electric rear light, done 5,000, perfect; ride 100 miles; 56 gas.—Troward, Heathurst, The Vale, Hampshire. [1893]

1914 Matchless, M.A.G. engine, 3-speed countershaft gear, chain drive, complete with Matchless handsome coachbuilt sidecar, which includes hood and screen, and all accessories; £75; guaranteed.—Wanchope's, 9, Shoe Lane, London. [X4241]

## Minerva.

3½ h.p. Minerva, red, T.T. bars, U.H. mag., in excellent condition; bargain, £20.—75, Crayford Rd., Taffel Park, N. [2036]

2½ h.p. Minerva, modernised, 1914 U.H. mag., 1912 B. and B. ride 50 miles to purchaser; photo; £9.—12, Asylum Rd., Peckham, London. [2214]

## Moto-Reve.

MOTO-REVE Twin Lightweight, mag., Droids, smart machine; bargain, £8/10.—Speechley, 45, Church Rd., Acton. [2197]

## Motosacoche.

1915 3½ h.p. Twin Motosacoche, 2-speed, air-cooled exhaust valves, with coachbuilt sidecar, brand new, shop-soiled only; £56.—Alexander's, 115, Lothian Rd., Edinburgh. [1935]

## New Hudson.

NEW Hudson, 1915, 2-stroke, as new, all accessories; £27.—Mydam and Co., 197, London Rd., W. Croydon. [2128]

NEW Hudson, 1916, model C, 2-stroke, £38; immediate delivery from stock; liberal exchange terms.—Below.

NEW Hudson, 1916, 6 h.p., passenger combination; £92/8; just arrived from works; liberal exchanges.—D. J. Shepherd and Co., Enfield Highway, London, N. [1939]

NEW Hudson, 1915, 2½ h.p., 2-stroke, £40 model, spares, 2 tyres (1 new), tube, belt, etc.; £29; owner enlisted.—Reid, Leadhills. [X4211]

NEW Hudson, 1915, 2½ h.p., 2-stroke, magnificent condition; 20 gns.; cheapest New Hudson in England to-day.—Julian, Broad St., Reading. Phone: 1024. [X3024]

NEW Hudson, all 1916 models in stock, also 1912 3½ h.p. 3-speed coach combination; 33 gns.; deferred payments if desired.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [2042]

NEW Hudson, 1914, 6 h.p., with 1915 improvements, 3-speed, clutch, Millford coachbuilt tandem sidecar, will take 2 adults, Miller's lamp set, and speedometer, not done 3,000 miles, cost £100, very smart outfit; a genuine bargain at £65.—367, Ivydale Rd., Nnhead. [2021]

## New Imperial.

NEW Imperial-Jap, 1916 models in stock, from £36/15.—Crow Bros., Guildford. [1878]

JULIAN'S, Broad St., Reading. Phone: 1024.—Immediate delivery of all New Imperial models. [X2838]

NEW Imperial, light tourist, immediate delivery; cash or easy terms.—Referee Cycle Co., 332, High Holborn. [0765]

NEW Imperial, 2½ h.p. J.A.P., 2-speed countershaft gear, nearly new, lamp, generator, horn; price £26.—Seen at 248, Bishopsgate, London. [2166]

1913 New Imperial, 2½ h.p., 2 speeds, very little used; owner enlisted; any trial; cheap, £27.—James, Bread and Cheese Hill, Thundersley, Essex. [1897]

NEW Imperials, 1916 models, in stock; sole London agents; trade supplied; few 1916 shop-soiled at reduced prices.—A. P. Key, 173, Gt. Portland St., London, W. [7832]

## The Motor Accessory Clearing House.

We buy or exchange as well as sell modern accessories and parts of all kinds. Send us what you want to get rid of and state your lowest price.

Special Clearance of new and unsoiled

## MOTOR CYCLES FOR SALE.

## New Imperial.

NEW Imperial, 1915, September, 2½ h.p., 2-speed, overhead inlet, T.T. does over 50; £30, or exchange; combination.—Clarke, Papco, St. Mary's Rd., Surbiton. [1944]

2½ h.p. New Imperial-Japs, latest models, just delivered, 2-speed and free engine, an ideal light-weight; £36/15; cash, extended payments, or exchange.—Wanchope's, 9, Shoe Lane, London. [X4240]

1915 New Imperial-Jap, 2-speed, variable ignition, new horn, 26 gns., very great bargain; 1915 New Imperial, No. 2 model, with 2-speed gear, clutch and kick starter, 26 gns.—Julian, Broad St., Reading. Phone: 1024. [X3025]

## New Ryder.

NEW Ryder, J.A.P. 2½ h.p., 2-speed, 1915½, new condition; offers.—"Grocers' Gazette," 71, Eastcheap, E.C. [1954]

## Norton.

1916 3-speed Countershaft Norton, 62 gns.; also several 1914 Nortons in stock, £45.—Parker and Son, St. Ives, Hunts. [2148]

1913 3½ h.p. 3-speed Norton, in excellent running order; £29; easy payments arranged.—Jones, Garage, Muswell Hill, N. [2243]

NORTON, 1914, 3½ h.p., T.T. model, in splendid mechanical order, very fast and reliable; £37/10.—Elce and Co., 15-16, Bishopsgate Av., Cannon St., E.C. [0479]

1916 3½ h.p. T.T. Norton, Philipson pulley, Big Four combination, chain drive, and the new sporting model all-chain drive; delivery from stock.—Wilkin, Hunter's Bar, Sheffield. [2189]

NORTON, 1915, 4½ h.p., 3-speed countershaft, kick starter, speedometer, run 900 miles only, with sporting £15 sidecar; £55, or offer.—Percy and Co., 337, Euston Rd., London. [2234]

## N.S.U.

N.S.U., 3½ h.p., mag., Whittle belt, good tyres; £5/10.—1, Melrose Rd., Merton Park. [1931]

## O.K.

1916 O.K. Junior, in stock; £27/10.—Cross, Agent, Rotherham. [X4230]

O.K. ladies', 1916 model, open frame, 2-speed, handlebar controlled clutch, brand new, in stock; £42/15. Tel.: 388. T.A.: Bicycles.—Robinson's Garage, Green St., Cambridge. [6867]

## Omega.

OMEGA, 3 h.p., Oct., 1915, 2-stroke, 2 speeds, speedometer, lamps, horn, etc.; £30, near offer.—3, Carson Rd., W. Dulwich. [2055]

## P. and M.

P. and M., 3 h.p., 2-speed, free; £13.—51, Elliott Rd., Chiswick. [2022]

P. and M., 1911, speeds; £25, bargain; exchange 2-seater.—8, Mayfield Place, Eastbourne. [2125]

P. and M., 1913, perfect, in new condition; £35, bargain.—39, Belmont Park Rd., Leyton. [2206]

1915 P. and M., 3½ h.p., 2-speed, looks new, hardly used; £63/10.—McKenzie, 24, Bargoed Terrace, Trebaris. [2228]

P. and M., 1910, in good order, will take sidecar, never been used during last 18 months, complete with all accessories; a bargain, £24.—Embro Cycle and Motor Co., Charlotte St., Hull. [2221]

P. and M. 6 h.p. Twin, 1915, complete with luxurious Gloria sidecar, Lucas lamps, speedometer, and every necessary requisite, equal to new in condition and appearance, and without a doubt the best turnout at the present time, an exceptional opportunity; accept spot cash (no offers) £97.—Embro Cycle and Motor Co., Charlotte St., Hull. [2220]

## Peugeot.

1913 7-9 h.p. Peugeot, Bosch 2-speed, kick start, Droids; bargain, £20.—39, Belmont Park Rd., Leyton. [2204]

## Pope.

POPE Twin, 12 h.p., torpedo, 2-seater, excellent order; examination; make good light boy; £25.—Hartley, Kegworth. [X4235]

POPE, the big twin, 1916 models.—Immediate delivery from Dougal and Co., 10, Merchant St., Bristol, sole district agents. [X3622]

## Precision.

PRECISION, 4 h.p., and sidecar, 3-speed, clutch, lamp, ready ride away; 24 gns.—Davies, 52, Gauden Rd., Clapham. [2015]

1914½ 3½ h.p. Precision, Bosch, B. and B. new tyres, tubes, belt, and valves, engine re-hushed, perfect condition; £22/10.—52, Huxley Rd., Edmonton. [1982]

## Premier.

PREMIER, 2½ h.p., fine machine; £17.—Garage, Larkhill Camp. [1979]

3½ h.p. Premier, perfect, new tyre, Binks, overhauled; £218.—82, York Rd., Battersea. [2215]

2½ h.p. 1914 Premier Lightweight, just been overhauled, perfect condition, complete with lamps and horn; £18/10, offers.—Cyril Taylor, Court Royal, Tunbridge Wells. [1973]

MARCH 16TH, 1916.

## Aluminium Pistons for Two-strokes.

**I**N this issue we publish an article detailing the result of a prolonged test of a two-stroke engine, particularly in regard to the formation of carbon. It will be observed from the experiences related that after a period of running extending to practically a thousand miles the two top rings suffered in the same way as in most engines of the two-stroke air-cooled type; that is, the rings became so firmly embedded in their grooves that ordinary means of removal became impossible, and the rings were broken. This result, it must be confessed, is not a particularly creditable one, and it once again brings up the question of the desirability of the use of pistons composed of a better heat conducting material than cast iron. Aluminium alloy, as we have already pointed out in recent articles in these columns, offers certain peculiar advantages for motor-cycle use, the chief of which is that an aluminium alloy piston may be made considerably thicker than a piston of the orthodox kind while weighing no more, yet by reason of its thickness it is able to keep its temperature comparatively low by dissipating the heat through its own bulk and also communicating it to the cylinder walls. Aluminium is also a far better conductor of heat than cast iron. The rapid burning of oil in the piston grooves and on the piston head, as experienced with miniature two-stroke engines, which as a regular part of their life are working nearly up to the limit, points directly to excessive heating of the piston. It is a well-known fact that carbon deposits do not form nearly so quickly in the case of a cool running engine as on an engine susceptible to overheating. Promising as the aluminium piston is on paper so far as the four-stroke engine is concerned, it offers fourfold possibilities in connection with two-strokes, which engines are still suffering from certain defects unknown to their four-stroke prototypes. Something must be done, and that quickly, to counteract these troubles.

## Looking Ahead.

**W**AR requirements in the matter of munitions have been the means of increasing two-fold and often four-fold the equipment of machine tools in different engineering works. The motor trade section, which is contributing its full quota of munitions, is at the present time abundantly stocked with lathes and machine tools of the latest labour-saving patterns, and in trade circles the interesting query frequently crops up, "What will become of these machine tools after the war?" Quantity production, when the car and motor cycle industry begins to resume its normal state, is a foregone conclusion, and many wise heads already foresee in the modernising of factories regardless of expense indications of keen competition ahead. Probably in the future there will be no such thing as firms producing several different patterns of machines; instead, each firm may standardise a single model and produce that design in quantities on the cheapest possible lines consistent with British quality—which is proverbial—and so bring about a probable decrease in selling price. These are the indications, though one may only conjecture at present; but the moral is that it behoves those manufacturers who at present are apparently oblivious to the motor trade in the rush for munitions to depute a portion of their engineering staff to keep *au fait* with changes in design, and to develop improvements which may not only be useful in the present war, but will also be instrumental in regaining for the British motor cycle trade its leading place in the world. An eye to the future at the present time and a careful formulation of post-war plans may mean the saving of many disappointments and much confusion when the time arrives for manufacturers to return to their legitimate business. Quantity production means a multiplication of markets for the disposal of goods, and overseas trade channels cannot be created in a day.

## A TWO-STROKE AFTER 1,000 MILES.

The Rapid Formation of Carbon and its Effect upon Piston and Rings. The Possibilities of the Aluminium Alloy Piston.

**R**ECENTLY we had occasion to remove, for the first time, the cylinder of a  $2\frac{1}{4}$  h.p. lightweight two-stroke which has rendered yeoman service to different members of our staff during the autumn and winter. During that period the machine has probably covered upwards of a thousand miles without attention of any kind, and, like most machines handled by a number of riders, receives more harsh treatment than one used by a single man (especially when that rider is the owner) who takes the greatest care and interest in his mount.

As all owners of the two-stroke type of motor must know, the difficulty of keeping the piston and ring grooves free from carbon deposit is one of the chief drawbacks to these otherwise wonderfully handy little machines, in most instances cleaning being required every 300 or 400 miles. We intentionally left the engine alone, being interested to see its condition after more than double that distance of very hard driving. The time came when knocking occurred after long non-stop runs, and on lifting the cylinder—quite a simple operation—the small amount of carbonaceous deposits on the piston top was most noticeable. The deposit had collected chiefly in the recess which forms the cylinder entrance to the transfer passage, but even here it was not thickly covered, and what there was was of a distinctly soft nature.

### The State of the Rings and Grooves.

The next thing to be observed was the piston, and we were much surprised at the apparent absence of top piston rings, but on close examination it was seen that the two top rings were so tightly gummed in with carbon deposit that there was little semblance of a join. It was, therefore, very evident that this gumming of the piston rings was the cause of the falling off in power during the last few hundred miles, and on occasions it had been found impossible to cover more than a few miles at any speed approaching full throttle without stopping, owing to the machine apparently overheating and preigniting. The next thing was how to remove the rings without breaking them, but after much patience had been exercised it was found to be impossible; even the process of removing the rings in pieces was none too easy, so firmly set were they. It was eventually accomplished with the aid of an old file, with the tang sharpened, and a light hammer. *Moral: Don't put off the day of cleaning too long if the rings are to be preserved.* New rings were afterwards fitted, and the improvement in the power output was immediately noticeable; the running continued to improve until about 200 miles had been covered, when the symptoms of preignition and pulling up were again slightly noticed.

The actual cause of this piston ring trouble on two-strokes is a point on which there has been much

discussion, and upon which little has so far been found out. That excessive heat, owing to the increased number of explosions, is the cause there is no doubt whatever, but how to prevent it—that is the question? A very likely cause of the trouble is that, upon the hot exhaust gas rushing out of the opening exhaust port, a backward eddy is set up, and before the piston rings have been completely covered by the cylinder beneath the port, the hot gases impinging on them cause the oil within the groove gradually to carbonise, rapidly causing the ring to become set. Apparently the only positive cure known at present for this trouble is water-cooling. That this is so was proved to us when, after removing the cylinder of the baby two-stroke, we also removed those of a water-cooled two-stroke Scott belonging to a member of our staff and which had covered roughly the same distance as the "baby," and found that the rings were perfectly clean and free, but that there was rather more deposit on the piston tops. The Clyno Engineering Co. have gone far to overcome the difficulty by making grooves which would collect oil, and so render the piston more or less compression tight at the top. The rings being situated at the bottom, are never exposed to the hot gas, and this method is more or less successful, though it is found that

Piston of a two-stroke engine after 1,000 miles running, showing where carbon deposit had collected.

the grooves themselves soon become full of carbon deposit, and cause to a certain extent the same trouble as the rings. It is common knowledge that inferior oil will cause this carbonisation to occur more rapidly, and for this reason greater care should be used in the selection of oil than would be the case with a four-stroke.

That there is an outstanding need for great improvement in the two-stroke piston is very obvious, as to take his cylinder off for cleaning purposes oftener than once a season is more than can reasonably be expected of the ordinary amateur, and with the present system it is apparently necessary, in order to obtain anything like the best results, to remove the cylinder about every 300 miles, which is absurd. Fortunately the task is a simple one, but compare this distance with 5,000 to 6,000 miles of the average water-cooled car engine. It will be remembered that in an article which appeared in *The Motor Cycle* of December 2nd, 1915, on aluminium alloy pistons, it was stated that, owing to the excellent heat conducting properties of aluminium, the presence of carbon deposit was almost imperceptible. It would, therefore, seem that these pistons may open up a simple and positive cure for this persistent and almost only trouble of an otherwise excellent type of engine, as, by the more rapid conduction of the offending heat, the oil, whether of good or inferior quality, will be less readily burned and carbonised.

# Occasional Comments by "Ixion"

## A Good Combination.

Keen as I have always been on the infinitely variable gear, I had omitted until last week to test one of the most modern innovations in that line, consisting of a three-speed gear in conjunction with a Philipson variable pulley. It need hardly be said that the outfit is truly delightful. You have no anxiety about belt slip; you know your emergency ratio is low enough for the ascent of Snowdon; you cease to be chained down to two or three arbitrarily selected ratios, none of which quite fits the grade you are tackling, and the lesser gradations of ratio are practically automatic, so that you are not eternally shifting a lever. I do not approve in theory of using two attachments where one will do, but the Philipson pulley is apparently as reliable and trouble-proof as an ordinary solid pulley. The Philipson device has not yet been applied very extensively to countershaft pulleys, though Mr. Philipson regularly uses such a pulley on his two-speed Douglas. But if—or when—it is, it will add a further refinement to our most modern machines.

## Other Makers Please Copy.

I always time delivery of my new machines, when possible, for a date at which I have plenty of leisure. I know that I shall have to procure a registration number; paint or "transfer" it on to the plates, which means taking the plates off, and replacing them; fitting a speedometer—say three hours, if one does not have to write to the speedometer maker for a fresh bracket which will really fit; fitting a lamp—say an hour, etc., etc. So that—with ordinary luck—one may take the road on the third day after delivery. Judge of my amazement when the newest machine arrived already numbered, already be-lamped both fore and aft, and—miracles have not ceased—already speedometered! I was doing 50 m.p.h. within an hour of signing the railway receipt. No, gentlemen! No, no, no! Wild horses will not drag from me the name of the laudable firm, at any rate till the war is over; they are up to their necks in munition work, and the rush of orders which this small publicity would ensure, would bring down their grey hairs with sorrow to the grave. But when the war is over, you shall hear the name; and the rest of our sleepy, stupid old trade will soon file their petitions.

## Aluminium Pistons.

On December 2nd last we published an article on aluminium pistons which was considerably more authoritative than we were permitted to disclose. Suffice it to say, that there are far more aluminium pistons in Government service than most people imagine, and that this type of piston promises to become very common on high-powered engines when the war is over. I sincerely hope that motor cycle manufacturers are not going to lag behind, because there is already ample evidence that the new piston will be even more valuable on air-cooled motor cycle engines than on big car and airship units. Contrary to general

supposition, it is not a "revving fake." I owned a small engine last year to which light aluminium pistons had been fitted in the interest of r.p.m., and whilst they gave me an extra 5 m.p.h. or so, they caused me some trouble with broken rings—at any rate I blamed them for the trouble so experienced. But when our technical experts got to work with aluminium pistons, they soon satisfied themselves that their real value was only experienced if the aluminium casting was made so heavy that no saving in weight was effected.

## Their Two Merits.

This surprising conclusion is based on two facts. One is that you cannot seize up a properly designed and constructed aluminium piston; you can work an engine so fitted at top r.p.m. for a far longer period than a cast-iron piston will stand. The other is that carbonisation is considerably retarded. Both merits are obviously due to improved cooling. Now seizure and carbonisation are the two worst defects of the modern motor cycle engine. Seizure, perhaps, only falls to the lot of "blindlers," so far as four-stroke engines are concerned, though the potterer not infrequently experiences it on two-stroke engines. But carbonisation is the common lot of all motor cyclists. Even if it were true, as some of our correspondents allege, that any sensible rider can get 4,000-6,000 miles out of a decent engine between decarbonisations (and such statements are gross exaggerations), it would be worth incorporating an improvement which extended the intervals to 6,000 and 8,000 miles respectively; *a fortiori*, the same argument is even more forcible in respect of two-strokes, for their rapid carbonisation is the worst blot on their good name. Therefore, the motor cycle manufacturer who makes himself thoroughly *au fait* with aluminium pistons before the war is over is the man who is going to get the trade; and all manufacturers who delay experiments and leave the new pistons to car designers and aviation engineers are—well, if I said what I thought about them, our emergency lady staff would strike; so I leave it to your imagination, dear reader.

## Preparing the Belt for a Tour.

I saw a member of the leviathan sidecar brigade getting his belt (yes, belts still linger, you know) ready for a tour. He gripped it in a vice and made two holes an inch apart through each end in less time than it takes me to describe it. To protect myself from an avalanche of letters asking for the make of punch which bites through  $1\frac{1}{8}$  in. rubber belting like an electric drill, I had better add that he used a ratchet brace. Two of the holes were occupied by the fastener bolts; the two surviving holes were filled up with spare bolts ready for what he quaintly called "der Tag"; he knew the northern hills would damage his belt joint before he got home, and what handier method could be devised of keeping spare bolts ready, whilst the filled holes avoided belt weakening.

# A MOTOR CYCLIST ON THE MÖWE.

## Adventures of a Sydney Rider on his way to England

**A** PATRIOTIC Australian motor cyclist, Mr. Arthur du Bois , set out from Sydney on November 13th last year for England with the object of enlisting in the M.M.G.S. We knew he had sailed with this intention, as he had acquainted us of the fact, but naturally we were surprised when, after a reasonable lapse of time, no news was heard of him. The reason was not far to seek, as recently he turned up and told us that his ship had been the gallant *Clan McTavish*.

Mr. du Bois , though of French descent, looks every inch a Briton. He is a motor cyclist of some ten years' experience, and has been the owner of many machines. He began his motor cycling career with three Saroleas, which were formerly known over here as the Kerry, then he had a four-cylinder F.N., which was followed by two Kerry-Abingdons; next came a twin Matchless fitted with the six-speed expanding pulley gear, and finally a 7-9 h.p. Harley-Davidson. About the two latter Mr. du Bois  was most enthusiastic. He has not done much competition riding, but about eighteen months ago he took part in a 400 miles twenty-four hour event organised by the Kookooburra M.C.C., and much enjoyed it. Kookooburra in the aborigine tongue means a laughing jackass. Asked about the price of petrol in Australia, Mr. du Bois  told us that, though the fuel costs no more on the coast than it does in England, it costs 2s. 6d. per gallon up-country in peace time, and he was amused to hear that we in England were grumbling at this sum in time of war.

### Early Tastes of War.

The voyage of the *Clan McTavish*, on which, as already stated, Mr. du Bois  sailed, was uneventful till she reached Dakar, when a small six-pounder gun was picked up as a defence against hostile submarines. Thereafter, nothing happened till they reached a point at 6.15 p.m. one day about 150 miles north of Teneriffe, when an innocent looking ship sailed across the stern of the *Clan McTavish* and signalled, "What ship are you?" The Britisher was, however, cautious, and replied with the same question. To which the unknown one answered, "*The Author, Liverpool*," giving the name of a ship she had sunk some days before. So she drew near, and suddenly signalled, "Stop! I am a German cruiser."

The British captain sent back the message "I am stopped," but at the same time told his engineer to go ahead for all he was worth, and his wireless operator to send the S.O.S. and the ship's position. "Stop your wireless!" flashed the *M we* (Seagull) and sent a shot across the *Clan McTavish*. The latter then replied with her little six-pounder, which was answered by a salvo of 7in. shell at 150 yards range from the raider. One shot killed fifteen natives who were attempting to

## To Enlist in the Motor Machine Gun Section.

escape in a boat, another carried away a winch on the forecastle. She was hit in the engine room, and also below the water line. The captain and the officer on the bridge calmly worked the ship until she was disabled and then gave in. Next a boat came from the raider filled with men armed with revolvers, who told the ship's company to get together what clothes they could and come aboard. Our friend followed the captain and went off in the *M we's* own boat. They were then lined up on deck, and Mr. du Bois  was questioned by an officer who held a revolver at his head, told him to hold his hands up, and had him searched. Then a sailor flashed an electric torch in his face, and—he laughed as he told us—he thought he was shot. Next day they were all put into the hold, where they found 250 prisoners taken from another ship. Next day all these were transferred to the *Appam* except thirty naval and military prisoners. Meanwhile the *M we* headed S.W. The prisoners were fairly well treated, and were allowed on deck for about an hour a day, except when there was a "show" on.

### Scare Caused by a Pig.

On January 22nd they picked up the sailing ship *Edinburgh*—an easy catch. Some stores and twenty-two prisoners were taken, and one of the *Clan McTavish's* men said he was sure the captain had had his wife with him as he had heard her screaming. This fortunately proved to be untrue as the scream came from a captured pig! The Huns then sank the *Edinburgh*. All the *Clan McTavish's* men were told they would be sent to Germany—news which by no means cheered them; and so they sailed on for some time and then reached muddy water, supposed to be the mouth of the Amazon. Here they were battered down for three days and three nights while they went up the river. Near here they picked up the *Corbridge* and later sank her. Next they caught the Belgian steamer *Luxemburg* and sank her too. Then they headed for the island of Fernando Narhona and captured the *Flamenco* and sank her.

By this time the *M we* was pretty full of prisoners. The *Westburn* was the next victim, and on her they put a prize crew, so when the *Horace's* turn came they sank her and put her crew on the former. Off Teneriffe the *Clan McTavish's* men were put on the *Westburn*, and the *M we* departed for a destination unknown. Then at last our heroes' trials were nearly over, as they told the *Clan McTavish* crew that they might all go free except the captain and the gunners. After Mr. du Bois  and his companions had been landed, the prize crew took the *Westburn* out to sea to a spot within the three-mile limit. A bomb was placed each side of her at a point between two holds so that four holds were blown into in all. The

*Westburn* took some time to sink, but gradually settled down on an even keel; then her stern went under, she raised her stern in the air till her foremast and one funnel were parallel with the water, and then sank beneath the waves. This incident occurred in sight of a British cruiser, which was powerless to intervene as it happened in neutral waters. The *Westburn's* prize crew then came back to land in boats and were interned, Teneriffe being Spanish territory. They

stated that they were glad to be out of the war. All agreed that the pirate commander-captain, the Burgrave Count von und zu Dohna-Schlodien, and his men behaved like sportsmen, but the brave *Clan McTavish* crew were none the less pleased to leave Teneriffe for England in the British liner *Athenic*.

[Mr. Du Bois's regret is that he is precluded from combatant service, as he was compelled by the Germans to give his parole.—ED.]

## GOOD SIGNS.

### EXPORTS INCREASE.

IT is gratifying to gather from the latest Board of Trade returns to hand, *i.e.*, those for February, 1916, that there is an appreciable increase in the number of motor cycles exported last month compared with both the previous month and the same period of last year.

As regards imports, the latest figures reveal an interesting fact. While the number of complete machines imported has decreased by 50% compared with the previous month and is an almost infinitesimal figure compared with February, 1915, the value of tyres and parts does not show such a difference.

For instance, in February, 1915, the value of tyres and parts imported into this country was £4,730, whereas last month it was £6,341. The number of complete motor cycles for the same periods are 501 and 8 respectively. This rather suggests that importing firms, in order to economise boat space, are

### IMPORTS DECREASE.

sending their productions to this country in parts to be reassembled here.

Looked at as a whole, the latest returns are satisfactory in that they show a lessening of the great gap existing until recently between imports and exports. This, of course, applies to the trade of the country generally, and the following figures show that the motor cycle industry is doing its part in the placing of the country on a more satisfactory economic condition.

#### IMPORTS.

## AUTOMATIC LUBRICATION.

### The Desirability of Supplementing Suction-drip in Cold Weather.

ONE of the machines I have been riding this winter—a vivacious 7 h.p. twin which requires lubrication in proportion to its vitality—is provided with a system of lubrication which depends upon suction from the crank case. This system is delightful so long as the temperature allows the oil to flow easily through the regulator; but during the winter months this temperature is not obtained till four or five miles have been covered, with the result that the engine is starved of oil if one's riding consist of short journeys.

In many respects the suction feed is vastly superior to the drip-feed, but it is, to my mind, inadequate unless a hand pump be fitted in conjunction. I notice the makers of my machine have this very necessary addition on the machines they themselves use for demonstration purposes, though the machine they sell to the public is fitted with the suction system only.

I have partly got over the difficulty by using moderately thick engine oil diluted with a few drops of petrol. The oiler is set at full steam ahead for the first three or four miles, whereupon the engine just begins to smoke; then the valve is shut down to the "normal feed" position, by which time the device has commenced working and requires no further attention.

When one has learnt the tricks of the trade, the suction system leaves little to be desired; but I know one novice who was landed for a new set of bearings on a brand new machine almost his first trip, simply because he was not acquainted with the fact that thick cylinder oil would not serve his purpose.

H.M.B.

an enthusiastic rider of a two-stroke  
Levis

## A Beginner's 1,200 Miles Tour.

Adventurous "First Run" from  
London to the Highlands and  
Back on a Lightweight.

**W**HEN my friends heard that I proposed to spend my holiday on a motor cycle they scoffed, naturally enough. Had I ever ridden before? No? Good gracious! Where was I bound for? "From London to Inverness-shire," said I, dubiously. Huh! Did I not know that those infernal machines required attention every twenty miles at least? Jones, the egregious one, was especially scornful, being himself a motor cyclist.

### An Alarming Prospect.

"What will you do, old chap," he pleaded anxiously, "when it is absolutely necessary to belay the carburettor? And *won't* you be in a pretty fix on some lonely moorland road, ten miles from the nearest house, when the machine refuses to budge, owing to the flooding of the high-tension grease spot!"

But I held to my purpose, so intent was I on taking advantage of the use of an almost new lightweight which I was offered for the fortnight.

The cycle was a 1915  $2\frac{1}{2}$ -3 h.p. Wolf, with two-stroke engine and single speed. Surely it is very much to the credit of the cheap modern motor cycle, and of the two-stroke engine in particular, that this machine should have run for well over a thousand miles, with the minimum of trouble, in the hands of a beginner, who had received only two minutes' instruction concerning the use of the brakes, the air lever, and the throttle.

"You see," said the owner optimistically, "there is really very little in a two-stroke that can go wrong. If the engine refuses to fire, look at the plug, which is, perhaps, the thing most likely to upset your calculations." And with this invaluable tip firmly in mind I resolved to start.

On Saturday the journey was begun. The weather was wet, misty, and cold, and with a sinking feeling I surveyed the cheerless prospect from the windows of my rooms. Having reinforced my reserves with an excellent road map and "Hints and Tips for Motor Cyclists," I set out by 'bus for Chalk Farm Road, where I got the motor cycle from the Adelaide Motor Co. Luggage consisted of a fairly large Gladstone bag, weighing about three stone, which, when strapped on the carrier, made an excellent back rest.

### Sound in Theory.

It should be made clear that, from diligent reading of *The Motor Cycle* I had some theoretical knowledge of the general principles governing the control of petrol engines; and it was this, together with the owner's few suggestions, that enabled me to set out in a fairly satisfactory fashion. Taking a big breath,

I "paddled" off, the size of my bag behind making a running mount too difficult at this stage. As the machine darted up Adelaide Road my conviction was that there was some reserve of power in the engine, which was doing its best to sling the machine from under me, and leave me and my bag on the muddy road. It was still raining, and Scotland seemed such a very long way off.

All went well until I had ridden cautiously for about a mile along Finchley Road, avoiding the slippery tramlines as much as possible. Then, on a slight gradient, the engine abruptly stopped firing. What, already! I pushed the machine to the pavement at the side of the road, and, in the presence of two interested small boys, unscrewed the plug in a calm and collected manner. It was almost spotlessly clean. A taxicab driver, grinning horribly, informed me that there was a garage about 300 yards along the road, so I replaced the plug and pushed the machine to this kindly haven. It was evidently lucky for me, I thought sadly, that the machine was a lightweight.

### The Expert.

At the garage there was a man, who, with an air of artistic detachment, was playing a jet of water from a hose on a muddy car. I waited for about two minutes, and then ventured a hint by blowing my horn. He turned off the water, and regarded me solemnly. "Well!" said he.

"This — machine won't go," I told him, and went on to explain how it stopped. He looked at the motor cycle in much the same way as a confirmed bachelor regards a three weeks old child.

"Imphm!" he ejaculated, after a long pause. "Have you tried the plug?"

"I have, and it's all right." This with a touch of pride.

Another long pause, during which he got down on his knees and stared fixedly at the flywheel. Then he had an idea: "Just you give it a turn along the garage," he said, "to see if it will fire now!"

I was already uncomfortably hot, but I did as he suggested—to no avail. The expert regarded with interest my hectic dashes from one end of the building to the other, and, when at length I stopped, he had the nerve to say that he was blown; further, he dunno what ailed it, and he advised me to wait for half an hour, when a man who was "well up in them things" would arrive. I did so, and I was able to go on my way rejoicing after an alert-looking young man had brushed up the magneto points and played with the carburettor.

## The new tyre for "A.J.S.," "Indian," etc.

*Avon Three-Ribbed with Voiturette (motor flat-bed) beads.*

**T**HIS new Avon cover has been specially built for heavy machines with voiturette (flat-bed) rims, such as the "A.J.S.," "Matchless," and "Chater Lea" (fitting 650 x 65), or the "Indian," "Harley-Davidson," "Williamson," "Henderson," and so forth (fitting 28 x 3in.)

Needless to say, the new Avon Three-ribbed has the correct type of car beads as well as extra wall-strength and generous weight of rubber. We confidently commend it to every "big" owner.

**A Beginner's 1,200 Miles Tour—**

Some evilly disposed, or perhaps ignorant, person had told me that St. Albans was on the Great North Road, so that when I saw a signpost pointing the way to that town, I made for it with unquestioning faith, rode through the crowded streets, and continued my way along a broad fine highway that appeared to be almost deserted, and promised unlimited speed.

This was glorious. The craving for speed was on the ascendant, and the milestones went flying by. In a happy frame of mind I was not disposed to stop, and it was not until I had covered nearly sixty miles from London that a large signpost, pointing in the direction in which I was travelling and marked "To Holyhead," made me pull up with a jerk. Where on earth was I! My perplexity increased when I saw another signpost pointing to the right, and declaring that that was the way to Northampton. The map was consulted, and I was soon bewailing my idiocy in not consulting it sooner. Evidently I had been travelling along Watling Street and was at that moment about thirty miles from the nearest point of the Great North Road!

**The Empty Tank.**

The obvious course in this predicament was to make for Northampton, about twelve miles away, and then strike north-east through Kettering and Stamford. This I decided to do, and I left the main road: but it was willed—no doubt for my ultimate good as a motor cyclist—that there should be further delay. Just after I had passed through a quiet village about ten miles from Northampton the engine stopped for the second time. For a wonder, I struck on the root of the trouble almost immediately—I had forgotten all about the petrol supply. A glance at the tank showed that it was empty. A passing boy advised me to try the village inn—called, I think, the Coffee Pot—for petrol, so I pushed the machine up a shocking hill back to the village, where the hostess yielded to my entreaties to sell me some of the petrol stored for her husband's car, and further, to obtain from a kindly neighbour sufficient oil to mix with the petrol. Thus equipped I went joyfully on my way, and about 7 p.m. reached Northampton, where I decided to put up for the night.

Sunday dawned cloudy and unsettled. It was 10.30 before I got away from the garage. The weather held until I reached Stamford, thirty-five miles away. Here I rejoined the Great North Road, and continued the journey in the rain to Grantham, where there was a stop for lunch and petrol; then on through Newark, Retford, and Doncaster. It was shortly after leaving the last-mentioned place that I fell in with the rider of a 3½ h.p. Humber and sidecar, with which he was on his way from London to join his wife at Harrogate. He overtook me while I was examining

my map at cross-roads, and we decided, after one of those informal introductions that occur so naturally in the freedom of the King's highway, to continue our way together to Wetherby, where our roads parted. We rode at a fair average speed, the little two-stroke making an excellent impression on my companion.

At Wetherby I said good-bye to my new friend over a tankard of ale, and pushed on alone to Boroughbridge (about twenty miles north-west of York). This was the end of my second day's run. I had covered about 150 miles from Northampton, a total which I regarded with infinite satisfaction. At Boroughbridge I found the Crown Hotel to be in keeping with the village—comfortable, quiet, and old-fashioned.

**Again no Petrol !**

There was heavy rain all the morning, and the belt, which had developed some slackness, was slipping on hills, though not very badly. The petrol supply was replenished at Darlington, and I continued my way

through Chester-le-Street—where there was a wretched lunch in a very gloomy hotel—to Newcastle. The main road into this city had more pot-holes and was generally in a worse state of repair than any other stretch encountered in the whole of the tour. On the other hand, the North road leading out of the city is capital, and I enjoyed a very fast run to Morpeth and on to Alnwick, where the belt was tightened.

From the summit of the hill leading out of Alnwick

it was easy running until the engine suddenly stopped firing about eight miles south of Berwick on a lonely stretch of road. In a most pessimistic mood I set the cycle on the stand, and went through the motions, so far as I knew them, of locating a fault. It was interesting, and possibly helpful, to find that the carburetter would not flood, and further investigation showed that the tank was empty. Here was a pretty business!

A farmer's son who came along, driving a pony and float, assured me that there was no petrol available within a radius of several miles, although there was an inn about half a mile farther along the road.

By this time I had taken off the belt, and was ready to push my machine to the inn, but awaited a possible friendly offer from my new acquaintance. It did not come, although there was plenty of room in the float.

Luckily with the belt off the machine was almost as easy to push as a pedal cycle, and I reached the promised inn comfortably enough. There was an amiable but futile conference with the landlord, who had no petrol, so I talked of putting up for the night, and he brightened up, business being dull. Just then a car rolled up to the inn, and the owner sold me half a gallon, with which I was able to continue my way to Berwick. Crossing the Tweed, it was pleasant

**THE WRITER'S MOUNT.**

The two-stroke single-geared Wolf, upon which the 1,200 miles tour described in this article was made. The rider was a novice at the time of the tour, which occupied a fortnight.

**A Beginner's 1,200 Miles Tour.—**

to reflect that I was 336 miles from London, and considerably more by the devious route I had chosen.

**Do your Own Repairs !**

At Berwick I put up for the night, discussing the chequered local history of the ancient borough with the landlord of the Waterloo Hotel, Mr. Turnbull, who had much that was entertaining to tell me of the times when the township was the favourite bone of contention between England and Scotland.

The machine started badly next morning, and stopped abruptly in the course of the ascent of High Street. I took it back to the garage, where it was found that the sparking plug terminal was broken. A very young mechanic—he looked about fourteen—repaired this for me. Foolishly enough, he placed the new terminal on the top of the cylinder so that he might hammer the wire firmly into its place. The third light tap took off a piece of the top fin, much to my annoyance.

**An Encounter with Sentries.**

It was not until 10.30 a.m. that I was able to leave Berwick and cross the border. Eight miles out, at

greasy tramlines at the junction of Prince's Street and New Bridge Street being too much for me. This was my first and only serious sideslip. My impression was that the front wheel collapsed suddenly, but on picking up myself and the machine—muddier than ever, both of us—I found that neither was damaged. Luckily I had been travelling dead slow at the time.

At least an hour was lost, and some unnecessary miles were covered, in finding the road to Queensferry. In order to avoid trouble with the Naval Censor, the less said about this very interesting resort at present the better. Many young naval officers were motor cycling into Edinburgh as I left the city, most of them with a passenger on the carrier, and apparently supremely indifferent to the perils of mud and wet tramlines.

**A Wonderful Descent.**

From Inverkeithing, on the other side of the ferry, to Perth there is a succession of small townships, each with its ten-mile speed limit, and each with streets of such an atrocious nature that none save a despatch rider on urgent business would attempt to exceed the limit. Near Perth there is an amazing run down Glen Farg. Mile after mile the road descends into a dark

THE JOY OF THE OPEN ROAD—A good example of Scottish moorland country.

Burnmouth, I was stopped by two sentries, one of whom, in the most businesslike fashion, carried a fixed bayonet, while the other was armed with a pencil and ledger. They signed to me to stop, and prudently I decided to do so.

"What's wrong?" asked I, with some misgivings.

"Spies!" was the succinct answer made by the young man with the ledger, and straightaway they began to ask me as many questions as there were columns ruled in their book. And when I had finally satisfied them, there were two more sentries at the other end of the village, with whom exactly the same formula had to be gone through.

After a pleasant run through Cockburnspath, Dunbar, and Musselburgh, I reached Edinburgh early in the afternoon. A few miles north of Dunbar a bird, flying in front against a head wind, swerved into the head light, and instantly fell into the road, apparently killed on the spot. The glass of the lamp was cracked. The rain was still falling as I entered the Scottish capital. I blush to record that the only stop I made here was an involuntary one, the network of

valley, thickly lined with trees, until one begins to fear that a wrong turning has been taken, leading the unwary and wicked motor cyclist to the nether regions. I reached Perth about 5.30 p.m., and decided to leave the last stage of the journey, the ride over the lonely Grampians, for the next day.

Wednesday morning dawned gloomily and threateningly. Heavy rain accompanied me for the twenty-seven miles to Pitlochry. A mile to the south of that fashionable little health resort, which nestles at the base of the Grampians, I ran into a blinding storm, the rain coming down in solid sheets. I took ten minutes' shelter under a railway bridge with four surfacemen, then rode into Pitlochry, where I had to wait for two hours while the storm spent itself.

It was after three o'clock when I got away from the place, the wheels leaving a wash on the rain-sodden roads like that of a thirty-knot destroyer. Singularly enough, at Blair Atholl, only ten miles to the north, there had been no rain since the previous day.

Then came the ascent of the Grampians. There are surely few highways in this country that equal in

**A Beginner's 1,200 Miles Tour.—**

grandeur this wild and remote stretch of the Great North Road. The surface is good, though the road, winding its way between the great mountains, is rather narrow in places. For twenty miles one continues the climb to the summit at Drumochter, and then slips down the other side of the mountains for about the same distance to Kingussie.

**Five Days in the Highlands.**

There was a thick mist lying over the mountains, adding to the wildness and scenic effects of this rugged countryside. The machine ran excellently, firing regularly at twenty miles an hour on the long ascent, and giving no sign of overheating.

The end of the northward journey was now in sight. The Wolf purred its way quickly through Kingussie and Aviemore to Carr Bridge. My friends—having, naturally enough, little faith in my motoring powers—were honestly amazed to see me pull up at the gate with a final triumphant hōnk, hōnk!

Five memorable days were spent in this quiet, picturesque Highland village, now fast gaining popularity among weedy southerners, who revel and grow fat in the mountain air. In these glorious surroundings,

The return journey was comparatively uneventful, and I was now beginning to understand the machine fairly well. There were, however, one or two lively incidents. At Newtonmore, where, like so many other Scottish villages, there is a 10 m.p.h. speed limit, I was pursued by a fairly large terrier while riding slowly through the main street. I slowed down, and the terrier, barking furiously, took the lead, trying to snap at the front wheel. The sequel was bad for me and worse for the dog. He was run over, and I had an inevitable spill, escaping lightly with only the front of the head lamp broken. The last I saw of the ferocious animal was the merest glimpse, as I was lying in a disadvantageous position in the centre of the road, the motor cycle lying on me: the terrier was tearing up a mountain side, yelping in a frenzied way calculated to awaken any dead Highland chieftains who happened to be buried there.

**TYPICAL SCOTTISH SCENERY.**

For the last twenty miles approaching Glasgow there was very little power in the engine. The fault was quickly diagnosed next morning as being due to the partial choking of the silencer holes. A mechanic at Messrs. Bell's garage, in Great Western Road, put the the two end plates in the vice and cleaned them out effectively. The

(Right) A moorland road over the Grampians.

it was a joy and inspiration to play nine holes before breakfast on the local golf-course, though a plus man might have sneered at its roughness. "Inspiration" is surely not too lofty a word, for my enthusiastic host and I were inspired with courage to dismantle the carburetter and one or two other parts of the Wolf, clean the parts that were accessible with petrol, and put the whole together again.

The internal economy of the engine was much as we expected it would be. What did surprise us was that the machine fired as well as ever—perhaps there was even a slight improvement—after we had completed our reassembling. Like myself, my host knew next to nothing of the practical side of motor cycle mechanism. During my stay in the North I made motor cycle trips to Inverness, Grantown, Aviemore, and other places in the district, sometimes with a passenger on the carrier.

top of my Amac carburetter had been shaken off, and it was a striking illustration of the effects of the war on the motor industry that at no place between Glasgow and London was I able to obtain this simple replacement. A makeshift repair was effected by using the lid of a baking powder tin, boring a hole in the centre for the needle, and fixing it as securely as possible with copper wire. It was far from petrol-tight, and my fuel consumption went up with a bound.

One result of this unexpectedly high petrol consumption was that—for the third time during my tour—I ran out of fuel thirty-four miles from Glasgow on the lonely moorland road three miles from Abington. A passing motorist very courteously gave me enough to carry me on to that village. The road from Glasgow to Carlisle, *via* Beattock, is magnificent; it has a fine surface, many long but not difficult ascents and descents, and pleasantly varied scenery.

### A Beginner's 1,200 Miles Tour.—

Leaving Carlisle on Friday morning, I took the lonely and rough mountain road *via* Appleby, Brough, and Bowes to Scotch Corner, whence there was good running once more on the Great North Road to Newark.

The following mileage is, I think, extremely creditable to the machine in view of the fact that it was ridden by an absolute beginner:

NORTHWARD JOURNEY.		Miles.
London to Northampton (afternoon only)...	68	
Northampton to Boroughbridge ... ..	152	
Boroughbridge to Berwick ... ..	130	
Berwick to Perth ... ..	100	
Perth to Carr Bridge ... ..	95	
	545	
RETURN JOURNEY.		
Carr Bridge to Glasgow ... ..	154	
Glasgow to Carlisle (afternoon only) ...	94	
Carlisle to Newark ... ..	176	
Newark to London ... ..	124	
	548	
Trip mileage in the Highlands (about) ...	107	
Total for fortnight ... ..	1,200	

### A Few Notes.

It will be admitted that the tour was rather an exacting test. I found that my engine gave ample power, even with heavy luggage on mountainous roads and a single gear. The gear was rather low, however, and it was necessary to keep the engine fairly well tuned up. I am told that petrol consumption by two-strokes is often unduly high. Considering my lack of previous experience, I was fairly satisfied with an average of about 100 m.p.g. I did not keep the Wolf, but the only reason is to be found in my new ambition to possess a passenger machine.

I thoroughly enjoyed my first motor cycling holiday, a wholly delightful change from the work and strain of London life. "*Toujours l'audace!*" exclaimed a motoring friend, when I told him of that rainy Saturday afternoon in London when I sat astride a motor cycle for the first time, and set out for the far away Highlands. Certainly my experiences should convince waverers, afraid of illusionary mechanical troubles, that the modern motor cycle is one of the easiest vehicles to drive, as well as one of the most reliable and enjoyable.

D. W. CAMERON.

## "THE LIGHTS O' LONDON."

The Metropolitan Police Area: Further Reduction of Lighting: What is a Tricycle?

IT is most extraordinary that the authorities seem to be absolutely incapable of making an order with regard to the lighting of vehicles which includes all types to be found on the road and at the same time admits of no ambiguity. For instance, powerful lamps are forbidden, but a powerful lamp is not defined; *tricycles* are exempted from the necessity of carrying two lights in front, but it is uncertain whether a three-wheeled motor vehicle is considered to be a *tricycle* or not.

The following regulations are included:

(11.) "The use of powerful lamps on motor and other vehicles is prohibited.

(12.) "Every vehicle on any street, highway, or road to which the public have access between half an hour after sunset and half an hour before sunrise must carry lamps as follows:

(a) "At the front two lamps displaying to the front a white light, except in the case of bicycles, tricycles, and handcarts, on which only one such lamp need be carried. One lamp must be placed on the extreme off or right-hand side of the vehicle, and the second lamp in the corresponding position on the extreme near or left-hand side of the vehicle.

(b) "At the rear, a lamp displaying to the rear a red light. The lamp carried for this purpose on any vehicle other than a bicycle, tricycle, or handcart must be placed on the off side or right-hand side of the vehicle.

"Provided that a handcart carrying one lamp displaying a white light to the front and a red light to the rear shall be deemed to comply with the foregoing requirements.

"The lamp or lamps must be properly trimmed, lighted, and attached so that the light is visible in the prescribed direction for a reasonable distance without obstruction by any part of the vehicle, its burden, the person in charge, the draught animal, or any animal led at the rear."

It will be noticed that bicycles and tricycles are excepted, but it is not clear whether tricycles include motor cycles and sidecars or three-wheeled vehicles such as the A.C., Morgan, Warwick, etc. It is an extraordinary thing that these vehicles should escape the attention of the authorities, as we consider it to be most necessary that every sidecar at the present time should have lamps showing its full width, and the same remarks apply to the three-wheeled tradesman's carrier of all types. We have called the attention of the officer of the Com-

missioner of Police for the Metropolis to the matter and await his decision.

In the Metropolitan Police Order it is not specifically stated that motor cycles and sidecars and three-wheeled trade carriers should carry two white lights in front, but such was clearly the intention of the police. So far, there has been no test case to prove that this is so, but we are informed that in the provinces the police have had no difficulty in enforcing the Order as regards those types of motor cycles.

## THE NORTON-WATSONIAN SIDECAR AMBULANCE.

Eminently suitable for either Military or Civil Use.

**W**E are now able to produce photographs of the Norton-Watsonian sidecar ambulance, brief details of which were given in our issue of March 2nd. This ambulance can be obtained either as a complete outfit attached to the 4 h.p. model Norton or as a separate unit for attach-

ment to any suitable machine. Although it was originally designed for ambulance work in connection with the war, there is no doubt that good use could be made of such an outfit for civil ambulance work in small towns where there is not sufficient call for the large motor ambulances such as are used in the bigger towns.

Lid arranged for conveyance of patient.

## AN EASTER TRIAL.

**D**ETAILS regarding the Easter Monday trial to be run by the Birmingham M.C.C., a brief announcement of which has already appeared in *The Motor Cycle*, have now been decided upon, and printed particulars are available for intending entrants. It is to take the form of an open reliability trial, in which may be embodied a petrol consumption test, starting from the top of Griffin's Hill, Selly Oak, at 9 a.m. It is open to everyone excepting single men eligible for military service, and it is expected that a large proportion of the entry list will consist of men engaged on munition work. Ladies are especially invited to compete, and if sufficient entries are received a special prize will be offered.

Honorary Secretary S. Charles Perryman informs us that he has already had some fifty applications for entry forms. There is, therefore, every indication that the trial will be well supported. Entry forms and full particulars may be obtained from Mr. Perryman, Warwick Works, Tame Road, Witton, Birmingham.

The body is constructed of three-ply wood, and is sufficiently large to take a full-sized regulation army stretcher. In order to reduce the vibration and road shocks to an absolute minimum the stretcher supports are mounted on separate springs. The body is fitted with a lid, and when not in use for patient carrying the whole can be shut up and used as an ordinary box carrier. When a patient is to be carried the lid is fixed up by steel supports, and with the aid of waterproof curtains secured by press buttons makes an entirely enclosed, warm and waterproof covering for the patient. The body is carried on a standard Watsonian chassis with large C springs at the rear, while the front is supported on coil buffer springs. Four points of attachment to the machine are provided. The weight of the body complete with stretcher is about the same as the standard touring body. The whole is finished in grey with the exception of the red cross painted on a white circle.

Raus Pinheiro, a prominent rider of Rio de Janeiro. He is second secretary of the Rio Moto Club, and a well-known competition rider on his 7 h.p. Indian.

## TIME TO LIGHT LAMPS

GREENWICH TIME.

March 16th	...	6.33 p.m.
" 18th	...	6.36 "
" 20th	...	6.40 "
" 22nd	...	6.44 "

### Heavy Fine for "Joy-riding."

Lieut. C. A. B. Budd, who is home on sick leave from the Front, was recently fined £10 at Eastbourne for riding a motor cycle at a dangerous speed. When he was stopped by the constable, a lady asked him if he was a despatch rider, but the motor cyclist answered "No, I am a joy-rider."

### Testing a Spring Frame by using Solid Tyres.

In order to test more thoroughly the effectiveness of the springing of his spring frame, Mr. Whiting is having a model built in which the wheels will be fitted with solid tyres. This should undoubtedly prove whether there are any weak points. The Whiting spring frame, it may be added, was described in our issue of November 11th, 1915, page 470.

### Does Joy-riding Exist?

The A.C.U. is making enquiries from the various motor cycle clubs with a view to ascertaining what amount of pleasure motoring is taking place throughout the country. The object is to combat the idea, which the daily papers are endeavouring to circulate, that motor cycles are used to a great extent for joy-riding at the present time.

Sgt. T. H. Hill, 1st Canadian Contingent, who has been with this Overseas force as despatch rider since it first landed at the seat of war. The machine is a 1915 Harley-Davidson, and Sgt. Hill has ridden it continuously in France for the last seven months, during which time, we are informed, the engine has not been taken down

## SPECIAL FEATURES

A TWO-STROKE AFTER 1,000 MILES.

A MOTOR CYCLIST ON THE MÖWE.

A BEGINNER'S 1,200 MILES TOUR.

### A Stolen Sidecar Outfit.

A grey Harley-Davidson motor bicycle, to which a torpedo-shaped Phoenix sidecar was attached, upholstered in blue leather, together with some accessories, was stolen from King Street, St. James's, on the afternoon of March 2nd. The registered number was LO 2521. A handsome reward is offered to the first person giving information which may lead to the recovery of the stolen property to E. C. Lendon and Co., 17, St. Swithin's Lane, E.C.

### Push Cycle like Motor Cycle.

It may not be generally known on this side of the Atlantic that the Hendee Manufacturing Co. make push cycles in addition to the Indian motor cycles. The former in their general outline greatly resemble, but for the absence of the engine, the well-known mechanically-propelled cycles emanating from the same factory. The impression is given by a small tank, shaped and slung *à la* petrol tank, containing a battery for the electric lamp; also by the double front forks and long braced handle-bars.

### The Useful Sidecar.

Farmers throughout the country are, as is generally known, seriously concerned at the shortage of labour, and anything that will economise work is in high favour. Hence, Mr. Claud Campbell, a Hampshire poultry farmer, is pleased to have a 4 h.p. Triumph and sidecar that he uses almost every day for conveying produce to market. Despite very bad roads in the vicinity, this machine has been and is performing most regularly, and Mr. Campbell says that by its employment he is able to attend markets further afield than when he had to rely on horse transport.

A YOUNG MOTOR CYCLIST WHO HAS GAINED THE D.S.M.

C.P.O. Stanley West, attached to the Motor Machine Gun Section of the R.N.A.S., who received the award for gallantry in keeping the Turks at bay during the evacuation of the Gallipoli Peninsula.

### Highest Speed in England.

Referring to the speed of 95.74 m.p.h. covered by the Australian rider Jack Booth on an Indian over a distance of half a mile, it is worthy of note that the highest speed ever accomplished on a motor cycle at Brooklands was 93.48 m.p.h. This was on an eight-valve Indian, the rider being Sidney George, who is now serving as an air mechanic in the R.F.C.

### That Precious Fuel.

With the prospect of petrol permits in the near future, the most casual motor cyclist will be interested to know how many gallons of petrol were imported last month. The figure is 7,522,377, but, according to the Board of Trade returns, duty has been paid on 8,065,347 gallons for the same period. In January 6,985,276 gallons were imported, and in February of last year the figure was 8,036,659.

### Sidecar Design affected by War.

A Birmingham firm, who up till lately has listed a sidecar chassis in which the main frame consisted of one long length of steel tube in the form of a U, now tells us that, owing to the Government having control of practically all the steel tube mills, long lengths of tube are now almost unobtainable. Consequently, until the termination of hostilities, the firm in question is dropping the single tube chassis and is standardising its model of the more orthodox pattern built up of shorter lengths of tube brazed together in lugs.

# War Time Economy

with Petrol up,  
means saving money  
on Tyres.

The New Palmer Four-Ply Fabric Tyre is really proving a revelation in what can be accomplished by a medium-priced tyre. Four plies of closely woven fabric of almost unpuncturable density, a tough, thick tread, extra reinforcement at the beads, rubber strip between casing and tube, carefulness in manufacture that has made the name Palmer famous the world over — here is a tyre at little cost that will recompense you for the extra you pay out in another way.

Think of Palmer Quality, then compare these  
Sizes and Prices:

	Per Cover.		Per Tube.	
	l.	s. d.	l.	s. d.
24 x 2 in.	1	6 6	6	6 0

Harman.

**Our Spring Number**

Thursday, April 13th, is the date fixed for the annual spring number of *The Motor Cycle*. Special articles and illustrations are in course of preparation

**The Sydney Motor Cycle Corps.**

Some forty members of this corps have enlisted for service abroad; the remainder continue to make themselves proficient in home defence. At frequent intervals field days are held, and the motor cycles play an important part

**Competitions Again.**

There are still spasmodic efforts to revive competitions in different parts of the country. Entries from armleteers or Service men are sought. Provided the price of petrol or the conditions of obtaining supplies do not become too impossible, a couple of events may mature at Eastertide.

**The National War Funds.**

At the week-end the principal war funds stood as follows:

The Prince of Wales's National Relief Fund	£3,073,000 distributed	£5,822,921	0	0
Fund for the Sick and Wounded		3,485,947	0	0
The Belgian Relief Fund		1,500,000	0	0
Tobacco Fund		101,665	0	0
The Queen's Work for Women Fund		168,640	5	9

**A Long Ride in Australia.**

A remarkably fine sidecar run has been accomplished by T. Smithson, the postmaster at White Cliffs, South Australia. White Cliffs is roughly 750 miles from Sydney, N.S.W., and Mr. Smithson, riding a 6 h.p. New Hudson sidecar with his wife and child as passengers, covered the distance in a week. When one considers the average Australian road and the fact that the route for the greater part

covered practically uninhabited country, some conception is gained of the performance. The return journey was also made in a week and not a single involuntary stop, we are told, was encountered either outward or homeward.

**Diesel Engines for Motor Cycles.**

Several interesting letters which we have received on this subject have been held over owing to lack of space in our correspondence columns. The general opinion seems to be that the Diesel engine is unsuitable for road work for several very good reasons: (1.) It is made only in large sizes. (2.) Its weight per horsepower is excessive. (3.) It must be run at a constant speed. The fact that the Diesel is made only in large sizes does not, of course, of itself prove that it could not be made in a size suitable for motor cycle work, but the other two reasons seem more or less insuperable. Also, considering the very high compression necessary, we should say that starting the engine would be a matter of considerable difficulty.

**Water as Fuel?**

A bright intellect has suggested that, as the extremely high compression in a Diesel engine, with its attendant heat, is sufficient to cause the combustion of the fuel which is forced into the cylinder in a liquid state, water should be substituted for oil, the idea being that this would be converted into steam, which would do useful work upon the piston. It is hardly necessary to tell our readers that this savours of perpetual motion, and contains a very obvious fallacy. In short the engine is itself expected to produce the energy which is supposed to drive it.

**Motor Cycling in the Philippines.**

Recently racing and hill-climbing contests were held at Bagnio, the capital of the Philippines, and were enjoyed by the inhabitants and natives.

**Fast Travelling in Tasmania.**

According to a Sydney cable, a rider of a Harley-Davidson has travelled from Launceston to Hobart, a distance of 121 miles, in 2h. 34m. 50s. (46.75 m.p.h.). This is claimed to be record time for the journey in question.

**A Youthful Despatch Rider.**

We read that a 13 years old Jewish boy, Reuben Ginsberg, is now on his way home to Montreal after serving twelve months in a Canadian regiment. It is stated that he acted as despatch rider most of the time, and was wounded at Ypres.

**Another Suggested Easter Trial.**

A reliability trial for Sheffield and district riders, to take place on Easter Monday, April 24th, is under contemplation. It will be open to Service men, munition workers, and armleteers, though at the present rate of calling up men there will not be many of the latter class left by Easter.

**At Home Again.**

We lately had a visit from W. C. Hemy, formerly in the sales department of the Service Co., Ltd., and well-known as a competition rider of a Clyno sidecar combination. Hemy joined the Army shortly after the outbreak of war, and has seen over a year's service both with the A.S.C. and as an R.E. despatch rider. Unfortunately, he has been invalided out of the Service, and must take up a civilian appointment again.

THE MOTOR CYCLE IN THE TRANSVAAL.

Members of the Indian Motor Cycle Club photographed at the Krugersdorp Town Hall on the occasion of a picnic held last month. As the name of the club implies, all members own Indian machines, and the large number in the illustration shows the popularity of this make in Johannesburg and district.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Central Office for Motor Machine Gun Service:  
Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Central Office for R.E. Despatch Riders:  
Mr. T. W. Loughborough,  
A.C.U., Pall Mall, London, S.W.

**D**URING the past week there have been two examinations of recruits for the Motor Machine Gun Service, one on Friday last, the second yesterday (Wednesday), at the Recruiting Office, Coventry. The list of men accepted by Mr. Geoffrey Smith at the first inspection is given on this page. Another fifty men were to be tested yesterday.

Applications for the M.M.G.S. continue to flow into these offices at the rate of about sixty per day, but in many cases they cannot be dealt with, owing sometimes to the fact that the forms are filled in carelessly and some important question left unanswered, or men request that they be accepted now to join up some weeks or even months hence, or "after the result of my appeal is known," but this is impossible. Readers will save themselves and the Editor much time and trouble if this fact be borne in mind. The applications for men ready to join up within a week or ten days of applying are at present quite sufficient to fill up the vacancies as they occur.

The next inspection of applicants is to be at the Recruiting Office, Masonic Buildings, Coventry, on Tuesday afternoon next, the 21st inst. Experienced

motor cyclists who are not called up in their groups prior to that date, and who can attend prepared to proceed at once to their training centre if accepted, are invited to attend between 2 and 5 p.m. Men of good physique with at least a year's motor cycle or car driving experience and medically fit for Overseas service are wanted.

## Important Note.

The Motor Machine Gun Service is now a part of the Machine Gun Corps, the formation of which was sanctioned by H.M. the King some months ago. Men accepted for the first named section are not necessarily employed in conjunction with machine gun sidecar outfits as hitherto, but may be drafted to armoured car work in all its branches.

A double page photograph of the First Light Armoured Motor Battery appeared in this journal of the date of February 24th. In these batteries are armoured cars with motor cycle mounted infantry as supports.

The conditions of enlistment are appended:

Pay, 1s. 2½d. per day, all found.

Enlistment for duration of the war.

Usual separation or dependent's allowances.

A form of application appeared in the last issue of this journal.

Owing to the absence of vacancies a number of motor cyclists who had been on the waiting list of the R.E. Signal Section for several months past were included in the week's recruits for the M.M.G.S.

List of men accepted on March 10th, 1916:

H. A. Allibone, Rushden.  
G. H. Bacon, Leicester.  
B. W. Bailey, Walsall.  
F. Barker, Berkhamsted.  
A. Barrett, Coventry.  
C. E. Bond, Bournemouth.  
A. Boswell, Coventry.  
O. W. Boulton, Redditch.  
A. Brockwell, Clapham.  
A. Brough, Leek.  
J. W. Brown, Hythe.  
E. Burgess, Dipton.  
G. Butler, Wolverhampton.  
C. Careless, Gamlingay.  
L. C. Chapman, Tideswell.  
W. Churchill, Leaford.  
C. Cocking, London.  
A. J. Crichton, Glasgow.  
A. Dean, Sutton-in-Ashfield.  
F. J. B. Donovan, Harborough.  
G. T. Dunkley, Kettering.  
F. J. Elliott, Burslem.  
J. A. Gill, Coventry.  
D. Godley, Mansfield.  
G. Gorman, Handsworth.  
H. Hammond, Blackpool.  
J. W. Harris, Kettering.  
E. C. Harvey, London.  
R. Herrick, Nottingham.  
T. Hood, Whitley Bay.  
H. R. Hope, Newington.  
L. Kemp, Cleethorpes.  
H. C. Kirkby, Leven.  
H. W. Locker, Lichfield.

(Continued on next page.)

## 5th LIGHT ARMOURD MOTOR BATTERY.

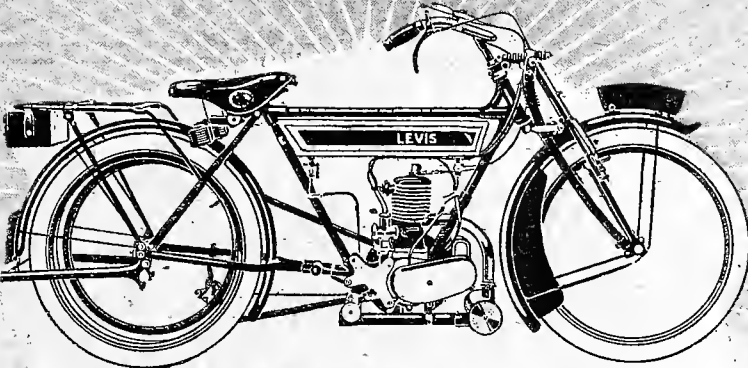

The officers are, from left to right, Lieut. A. R. Gurney, Capt. Scriven, and Lieut. W. T. C. Barnes. The first battery of this kind, with its complete equipment of Leyland armoured cars and Triumph motor cycle mounted infantrymen, was illustrated in our issue of February 24th.

**MILITARY NOTES.****WHAT ARMY REPAIRERS HAVE TO CONTEND WITH.**

THE reproduction on this page of a damaged motor cycle is from a rough sketch made by a repairer at one of the bases in France. It was made from an actual machine that had been hit by shrapnel, and the extent of the damage may be gauged from the following:

Tank in ribbons.  
Oil pump cut in two.  
Second tube bent and top tube blown away.  
Down tube bent and rear stays badly damaged and separated from seat lug.  
Silencer peppered and extension pipe bent and cut up.  
Handle-bars distorted. Horn cut about.  
Front wheel less two-thirds of its spokes.  
No magneto, drive cover shrapnel punctured.  
Change speed lever badly damaged.

A W.D. Triumph motor cycle after being hit by shrapnel. Reproduced from a rough impression made by an artificer at a repair base in France

From this one gathers that the work of motor cycle artificers calls for all their previous experience in civilian life in the repairing of machines. Our correspondent was at one time in the testing department of a well-known Coventry firm.

**DESPATCH RIDERS' MACHINES.**

OF the letters we receive every day from despatch riders at home and abroad, the great majority speak in high terms of their mounts, and the minority suggest minor alterations and improvements as a result of experience on active service. It was, therefore, rather a surprise to have a letter from a sergeant in an R.E. Signal Co. a few days ago, criticising from every point of view the motor cycles supplied to despatch riders. Our correspondent indulges in a very drastic criticism, and says that it is time the manufacturers supplied machines for the job, instead of machines similar to those sold to the ordinary public.

Nobody suggests that the despatch rider's mount is perfect, but we hardly

agree with our correspondent that the average machine is as bad as he would have us believe. And now that manufacturers interested have seen their productions at work under active service conditions, the points that do require improving will doubtless receive attention.

**A SAILOR MOTOR CYCLIST.**

THERE is nothing a sailor on leave likes better than a run on a motor cycle. When, in addition, he was in the trade before taking to the sea at the outbreak of war it is certain that he will leave no stone unturned to have his wish gratified when he gets a few days on land.

W. Goodwin, a snapshot of whom appears on this page, belongs to the latter class. Before the war he was chief tester to the Bradbury Co.; now he belongs to the Senior Service.

The outcry against so-called pleasure motoring Goodwin, like all of us, considers absurd, and he instances how much he appreciates a

good run on a motor cycle after the strain of watching for the enemy on board a big war vessel.

W. Goodwin, formerly chief tester of the Bradbury Company, and now in the Senior Service, goes for a spin on the occasion of a few days' leave.

In conclusion, Goodwin pays *The Motor Cycle* a compliment by saying how it has brought friends closer together during the war. "I myself have been able to locate motor cyclists from whom I should never have heard had it not been for your paper."

**SIDECARS FOR MILITARY RIDERS IN WINTER.**

GEORGE TOWNSEND, formerly a tester employed by Messrs. Phelon and Moore, in sending the photo-

Military P. and M. with light sidecar, being an adaptation of the scheme suggested by *The Motor Cycle* in the early days of the war to overcome the difficulties encountered when riding solo over winter roads in the war zone.

graph reproduced herewith, says: "I send you a photograph of the P. and M. after twelve months' active service in the most advanced positions over the worst roads. This is still going strong with the 4th Batt. Duke of Wellington's." The sidecar is one of the few specially light ones built by Messrs. Phelon and Moore for the War Office according to our suggestion to overcome difficulties encountered when riding solo over winter roads. A more comfortable customary type of body was eventually adopted as a standard.

# OBSTACLES TO OVERSEAS EXPORTS.

## Manufacturers' Evidence of Delays.

**I**N response to our note to manufacturers on page 231 of the last issue, we have been furnished with overwhelming evidence of the delay occasioned (1) on the rail, (2) at the docks, and (3) in obtaining a licence from the Board of Trade to export motor cycles

and accessories to overseas countries.

Several manufacturers reiterate that they are only too anxious to respect Government appeals to specialise on export trade, but they find almost innumerable obstacles in their path. The evidence, with which we have been

provided, we propose to submit to the Board of Trade, in the hope that light on the subject may be the means of an improvement in the existing conditions.

We shall revert to this matter in our next issue, as it is one of considerable importance.

# MOTOR CYCLES ON THE ITALIAN FRONT.

(By our Italian Correspondent.)

**H**AVING been recently privileged to visit one or two towns close to the Italian front, one of which is the residence of the General Headquarters, I should like to give a few of my impressions of the trip.

Of course, there is great activity everywhere, and the motor traffic is most intense, and everywhere the motor has superseded the quadruped. The roads, however, which in that part of Italy were renowned for their good surface, are now in a pitiable condition, partly on account of the extremely bad weather that has prevailed since last autumn (snow and rain being almost continuous), and also on account of the heavy motor traffic, which is so intense that it is absolutely impossible to repair the roads. The mud, therefore, is inches deep and the roads full of pot-holes, which render motor cycling a most arduous and dangerous task, and several casualties amongst the despatch riders are due to falls and skids which cause collisions with other motor traffic. That is one

of the reasons why the sidecar has been so largely adopted in the Italian Army, a suggestion which I remember was put forward in *The Motor Cycle* before the winter campaign.

The largest number of motor cycles are of British make, and I was informed that an order for 100 W.D. Triumph machines had just been placed. There are already some Triumphs in service, besides Ridges, Ariels, Douglas, Matchless, Clynno, and Indians, and the Italian machines are Stucchi, Borgo Frera, and Bianchi. The Motosacoche both 3 and 6 h.p. are largely used, the latter, of course, with sidecar.

## The Repairing Arrangements.

Besides the repair shops at each centre there is one central depot, where all the new machines are sent by suppliers to receive the final test and then be sent out according to the demands of the different zones, and where the machines needing serious repairs and overhaul are also sent. There are about 150 soldiers

working in this place in a most up-to-date and well-equipped workshop, where certain parts, if they cannot be supplied promptly by the makers, are made on the spot. This workshop has also started turning out some motor sleighs, the invention of one of the head mechanics, which are something after the style of those of American origin which have been illustrated from time to time in *The Motor Cycle*, and the first model was fitted with an Indian 7-9 h.p. engine.

Motor cycles are used for despatch riding, and sometimes also for carrying officers (pillionwise) on urgent business and in places where a car cannot get past; and the sidecar machines for the same purpose, besides carrying supplies and ammunition, wounded, and latterly machine guns.

On the whole, I may say that I received a most favourable impression of the motor service in the Italian Army, which seems to be organised on business-like lines, and works with method and regularity.

# THE PETROL SUPPLY AND THE FUTURE OF PRIVATE MOTORING.

**S**INCE the statement in last week's issue there have been no new developments. What we foretold on that occasion still seems likely to be fulfilled. The Royal Automobile Club published an appeal for petrol economy at the end of the week, and though this was sensible and moderate in its suggestions, it erred, in our opinion, in urging the motoring public to support the railways instead of using the self-propelled road vehicle. This seems reasonable at first if we consider that the motor car and motor cycle use foreign "grown" fuel while the train uses coal produced at home, but surely the railways have enough to carry at present, and any mode of travelling which relieves congestion on them ought to be encouraged rather than discouraged. No one desires to spend money unnecessarily during war time, but if motor cycling is enjoyed in moderation and brings health to the brain-weary city worker, it ought not to be denied him if no one suffers in consequence. And no one does. There is plenty of petrol in the country, and even if there were less than there is now the amount wasted in the services would more than suffice to allow every motor cycle in the kingdom to enjoy a few

hours' fresh air in the country during the week-end. It is argued that a brisk country walk is better for the health than a motor cycle ride. This may be so, but those who live in our large towns have to spend train or tram fares to reach a suitable starting point for their perambulations. Wherein then comes the saving? And what about the numerous delicate women who cannot walk? Are they to be denied a health-giving ride in the sidecar? The more one considers it the more one thinks that the appeal of the National War Savings Committee was, as Mr. Gerald Biss says in his excellent article in the *Sunday Times*, the outcome of "gross prejudice and misconception, ill-judged and worse expressed."

## Motorists Combine.

Motorists have at last banded together to utter a most urgent protest against the appeal, and the R.A.C. General Committee has appointed a special sub-committee to gain facts and figures to prove that "joy-riding" is practically a dead letter, and to emphasise the work done by the private motorist and motor cyclist during the war. In this controversy the motor cyclist holds, at first

glance, a more difficult position than the car owner, as it is more difficult for him to prove that his vehicle can be used for other than pleasure purposes, owing, of course, to the fact that it carries one or at the most two persons. It must be remembered, however, that the solo machine, even if used entirely for pleasure purposes, consumes an infinitesimal amount of petrol, so little, in fact, that if the use of the motor cycle were stopped the amount of fuel saved to the nation would not be worth considering. But the solo machine is not the selfish vehicle it is made out to be; it brings the munition worker quickly to the factory, it carries the special constable, the country doctor, and the commercial traveller, while the sidecar machine, as has lately been proved, can and does not only do these things, but is quite useful for the transport of slightly wounded cases. Let us therefore use our motor cycles in moderation; let us buy British machines when we can get them, or if we buy those of foreign make, let us pay the extra duty with all cheerfulness, but let those who have their machines use them for health and business, but certainly in no way so as to prejudice the nation's good.

**The  
LIGHT CAR**

Published

Every Wednesday

Price 1d.

Of all Newsagents.

"MANY of your correspondents ask questions, some 'Which is the Best Light Car?' and I have not yet noticed the correct answer. Possibly modesty forbids. I have, however, no hesitation in saying that the very best Light Car in which any motorist can invest, with the sure certainty of getting best value for money, is the little cream-coloured paper published every Wednesday.

"I am a knight of the road, and have used motor cars for the past twelve years. By chance I picked up a 'Light Car,' probably attracted by its nice clean get-up, and now look forward to Wednesday morning with pleasurable anticipation. I believe I have read all—or nearly all—the other motoring papers, and would sooner give up my cigars than miss the little cream-coloured 'Light Car.'

"The correspondence columns are not only extremely interesting, but very informing. 'Disconnected Jottings' by 'Run-about' are always worth reading, and they are the first to attract my attention."

## SOME A.B.C. IMPROVEMENTS.

Enclosed Kick Starter; New Shock Absorber.

SINCE our last description of the  $3\frac{1}{2}$  h.p. A.B.C. this interesting machine has been improved in several important details; for example, the kick starter mechanism has been entirely enclosed, so that this important part of the machine is adequately protected from the elements. Many of the machines which have been at the Front, and have not had this protection, have suffered from kick starting gears which have been rendered completely useless owing to the excessive amount of mud they have collected. The illustration shows the neat way in which

Bowden wire mechanism which actuates the clutch.

## Transmission Shock Absorber.

Yet another item of interest which has received improvement at the hands of the A.B.C. designers is the double cushion drive, a form of transmission shock absorber which is at once neat and effective. Of the two discs shown, that on the left-hand is attached rigidly to the wheel, while the sprocket on the right-hand is mounted loosely. The two are held together by means of bolts and separated by a special form of washer, which really consists of a washer and two short tubes all in one piece. Through these pass bolts, the heads of which are slotted to take a screwdriver, while the end takes a nut; consequently, on the first few impulses of the engine the shock

Enclosed kick starter on  $3\frac{1}{2}$  h.p. A.B.C.

this is carried out in the case of the A.B.C. At the bottom of the pedal it will be noticed that there is a disc with a milled edge with holes in it to which is attached the clock spring, which serves to return the pedal to its normal position after it has been depressed, and if at any time it should require adjustment, this is effected by turning the milled disc just referred to. After it has been used the pedal returns to the position shown in the sketch, and comes to rest against a rubber block. In the lower portion of the illustration there will be seen the

Exhaust outlet arrangement on 249 c.c. A.B.C. engine. On the 494 c.c. engine the outlet is taken from the side of the valve boxing instead of underneath.

on the transmission is absorbed by the rubber blocks, which are sixteen in number.

## The Exhaust Valve on the A.B.C. Lightweight.

In the description of the Baby A.B.C. (60 mm. x 44 mm., 249 c.c.), in our last week's issue, it was mentioned that a different type of cylinder head had been fitted, in which the exhaust was underneath. Owing to the omission of the word "outlet," it would lead one to suppose that the exhaust valve was underneath, but this is not the case. The well-known feature of the A.B.C., in which the exhaust valve is of the overhead type, while the inlet occupies the place usually taken by the exhaust, is still retained. This, of course, makes the engine exceptionally cool, as the exhaust valve stem is exposed to the air, and the inlet is cooled by the incoming gases.

New  $3\frac{1}{2}$  h.p. A.B.C. transmission shock absorber

### Two-stroke Design.

Sir,—Several makers have, in answer to Mr. Martin's article in your issue of January 20th, eulogised their own particular make, and stated that their machines could be run at wonderfully slow speeds without four-stroking. Be that as it may, particular cases are of no practical importance, and surely no one will assert that the general run of piston-port-operated two-strokes will admit of satisfactory automatic car type carburation. A. C. WICKMAN.

### Pleasure (P) Motoring.

Sir,—I have read with interest the letters of criticism of the National Organising Committee for War Savings proposed ban on pleasure motoring, and I am more convinced than ever that many people still fail to realise the seriousness of the war, and still carry on their pleasures of pre-war times, in spite of appeals from the heads of the nation for rigid economy.

I am living in a district within seven miles of London, in which there are three factories engaged on Government work (I might add that I work in one of them), and the majority of men who ride to work on motor cycles at the present time used to do the same journey on push-bicycles before the war; also several of my friends have purchased machines with the "silver bullets" which should have been invested in the War Loan.

It must be remembered I am writing of a very small spot of the country, so, if that can be taken as a basis, there must be hundreds of new owners during the last twelve months who are motoring for pleasure only. Consequently I endorse the opinion of the N.O.C., since there are other inexpensive pleasures in which to indulge.

I think the phrase "Do your bit" should be displaced by "Do your utmost."

### AFTER THE WAR MOTORIST.

Sir,—With regard to private owners laying up their motors, I think it very hard on such men as myself. I am a miner: I work underground eight hours a day, six days a week, and the only chance I have to steal a bit of fresh air is at the week-end. Has not a man earned the privilege of having a run with his wife after being below all the week in foul air? It is the only bit of pleasure we get. I have not had a ride this year yet, but I have paid my £1 as usual. Shall I lose that also if I have to put my motor away?

UNEASY.

Sir,—I enclose a couple of snapshots taken on Birdlip a few days ago. They were taken just below the second bend. There had been no traffic on this hill for days, the snowdrifts in places being 3ft. to 4ft. deep, and a high-powered car failed hopelessly at the foot of the hill. My machine, which is a 6 h.p. Rex outfit, successfully climbed the hill, but my wife had to sit on the carrier in order to get sufficient grip on the back wheel. The frozen snow very forcibly reminded me of the *pavé* on the other side.

E20

## LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

I was interested in recent correspondence on "Pleasure Motoring," and I fully endorse "Subaltern's" views in the issue of March 2nd. I am home also on sick leave, and I use my sidecar for health and pleasure, and I venture to think the carping critics of "pleasure motoring" ought to utilise their literary (?) energies in less puerile vapourings:

M. VACY-ASH, Capt., M.T., A.S.C.

### A Board of Selection.

Sir,—A perusal of your paper for February 24th reveals a photograph of a machine giving "universal satisfaction" at the Front. Closer examination of the photograph reveals a leather strap entwined round the front forks. Nearly every machine of similar make that one sees over here is similarly treated. I feel inclined to question the universality of the satisfaction after the number of machines I have seen treated in this way. Riders tell me that their machines are unfit to ride over bad *pavé* until their alleged front springing has been converted into practically a rigid fork. To my mind this seems an irrefutable argument in favour of the Board of Selection, of which your paper has constantly urged the formation.

A Board composed of engineers and practical riders, with a wide riding experience, would never pass as fit for D.R. service machines which when issued required immediate alterations to make them roadworthy. A. LINDSAY.

Boulogne.

Capt., R.A.M.C.

### An Appreciation.

Sir,—I feel almost compelled to write you an appreciation of *The Motor Cycle*, which I receive regularly every week in hospital, and which I also received regularly in France. I think I look forward to receiving this more than any other paper, for it never lacks interest, and is always so up-to-date and persevering in any new ideas which it puts forward.

I joined the R.E.'s in September last, but I could not get on as a despatch rider for there were no vacancies. I was in France about three and a half months when the despatch rider of our company went on leave and I offered to take on his job, for I had had three years' riding experience on various machines. Unfortunately my job did not last long, for on the third day, December 28th, I was wounded, a piece of shell going in just above my hip and entering the backbone, where it still remains. Thus I have what might be termed a "reinforced" backbone. The unfortunate part, one might say the "irony," of the business, however, is that the reinforcement is German iron, and so I am no longer all-British. I am hoping that in spite of my injury I shall be able to indulge in the sport again.

STANLEY LOCK (Cpl.), R.E.

Scenes on Birdlip, taken during the recent snowstorm. (See letter from Capt. Vacy-Ash.)

### The Removal of Cylinders.

Sir,—With reference to the particulars in your issue of the 17th ult. of an alleged patent by F. E. Etwell, Toronto, Canada, and the letter in your issue of the 9th inst. from the Rex Motor Manufacturing Co., Ltd., applying to a device for the easy removal of cylinders. In the early part of 1915 we manufactured and supplied to the public several machines embodying this feature. Our models were so designed that by withdrawing two bolts and operating two specially-designed oil and petrol pipe unions, the tank and bottom rail were separated from the remainder of the machine.

The cylinder on the present-day 4½ h.p. Quadrant is so easily detached that we have not found it necessary to retain this feature, although, in the event of our marketing a twin-cylinder model in the future, we shall in all probability adopt it as standard.

QUADRANT MOTORS.

### A Suggested Electric Outfit.

Sir,—Having read with interest the various articles of late in your paper on the subject of electric lighting, I shall be much obliged if you will kindly publish the following suggestion, which I think should work quite well in practice.

The ordinary magneto with which a motor cycle is usually supplied is removed, and is replaced by a direct current dynamo suitable for burning two electric lamps in series. An ordinary commutator is now fitted to the dynamo, and so timed that it "makes" when the spark is required, and

A suggested electric outfit. See letter from "Midshipman" on this page.

only remains in the make position for about 5° of revolution. From this commutator a lead is taken to a vibrator, and that in turn supplies the plug with high-tension current. The dynamo must be driven at the same speed relative to the engine as the original magneto was, in order that the timing may remain correct. The lead to the head lamps is now taken from the dynamo side of the commutator; thus it does not pass through the commutator at all, and so a steady current for the lamps is thus taken from the dynamo in parallel with an intermittent current for the vibrator.

The reason that the lamps should be in series is that when the vibrator is taking current there will be a slight change in voltage, and if the lamps are in series the change of voltage at each lamp will only be half what it would be if the lamps were in parallel, and hence the lamps will not be so likely to flicker. A resistance in the circuit will help still further in this respect, provided it does not reduce the current too much. A sketch of the connections is appended for the sake of clearness.

MIDSHIPMAN, R.N.

Sir,—The interesting letter under the *nom-de-plume* "Engineer" confirms my own long-formed opinion that the magneto does not by any means represent the last word in motor cycle ignition devices.

For years motor cyclists of the later school have looked upon coil (i.e., transformer) ignition as a system necessarily much inferior to the magneto, since the latter has almost entirely displaced it. The reason for the change, however, is not from any inherent defect of coil ignition as such, but may be found in the unsatisfactory service given by the battery in the olden days, owing to trouble and expense of frequently having the battery charged, or running the risk of getting let down on the road, coupled with the general lack of permanence of the connections.

Those of us who remember the perfect ease of starting, good acceleration, and silky running, even when slowed down on a tolerably high gear, will welcome the possibilities opened up by "Dyna-Transformer" ignition.

(Your pardon, "Engineer.") Why, by the way, does "Engineer" object to the name dynamo? It is the only word we have which describes specifically a machine for creating a difference of electrical pressure by dynamic means. The word generator equally describes a machine for producing petrol air-gas, an acetylene generator, or a dynamo. If the name dynamo offends the aural susceptibilities, let us have some descriptive term, such as "volt-mill" or "amp-churn," which cannot readily be abbreviated, in the way that magneto has been contracted to "mag."

I do not find myself altogether in agreement with his suggestion for a self-starter. In the first place, a very much larger and heavier equipment is required, and an extravagant rate of depreciation is incurred; secondly, the electrical self-starter has been already tried in connection with motor cycles and found wanting; and, finally, with transformer ignition and a good kick starter the personal exertion required is about on a par with winking.

ELECTRICIAN.

### Compression Ratio.

Sir,—On page 218 of *The Motor Cycle* for March 2nd, in the answer to letter from "W.H.," I think there is an error.

With a compression ratio of 4:1 the compression space of a 500 c.c. engine would be  $500 \div 4$ , and not 3 as stated, or  $4 = \frac{500}{x} \therefore x = \frac{500}{4} \therefore x = 125$ . So that the compression space in a 500 c.c. engine having 4:1 ratio would be 125 c.c.

*The Motor Cycle* is a most interesting publication, and such articles as Capt. A. Lindsay's, printed a few weeks ago, are most helpful.

ENGINEER.

[The answer given in *The Motor Cycle* is quite correct, for in calculating the compression the combustion chamber must be included as well as the volume swept out by the piston. Taking atmospheric pressure as 15, a 4 to 1 compression ratio will mean a pressure of 60 lb. per square inch. One atmosphere is already in the combustion chamber, and four atmospheres are required, therefore three must be in the cylinder before compression takes place. Hence the

compression space for a 4 to 1 compression equals  $\frac{c.c.}{3}$ , or in the case of a 500 c.c. engine—

$$x = \frac{500 + x}{4}$$

$$4x = 500 + x.$$

$$3x = 500.$$

$$x = \frac{500}{3} = 166.6.$$

This is, of course, a simple mechanical calculation, and takes no account of the heat engendered by compression, or that lost through the cylinder walls.—ED.]

### Diesel Engines for Motor Cycles.

Sir,—I was much interested to see a letter in last week's issue on the subject of Diesel engines for motor cycles. The fact of being able to do away with electrical ignition is not so important as are the possibilities of cheapness and controllability during ignition of the entire mixture. In most Diesel engines liquid fuel is driven in by compressed air, and there is a certain period available for gasification.

Even on large engines the amount of liquid fuel per stroke is very small, and therefore the only method of control is often to cut out one cylinder. Now on a motor cycle softness of control is of greater importance than fuel consumption, and this is one of the reasons why I suggested some years back that if the liquid were converted into a gas a large volume of controllable fuel would be obtained, admitting it on any system of forced induction to the engine. Paraffin and similar fuels, owing to the difficulty of complete vaporisation under varying temperatures and pressures, are exceedingly liable to give a dangerous deposit in the cylinder, but this is certainly no reason for not experimenting.

In my humble opinion the carburetter is one of the parts of a modern motor which is exceedingly far from finality, no matter for what purpose the engine be designed.

A. M. LOW, A.C.G.I., D.Sc., etc.

## A NEW COMET SIDECAR OUTFIT.

### ANOTHER LIGHTWEIGHT COMBINATION.

**T**HE lightweight sidecar outfit is undoubtedly gaining in popularity for light touring and town work.

This is probably due more to the low first cost and the small running expenses than anything else, and for this reason several firms are now making complete outfits specially constructed for this purpose. Mr. A. H. Haden, maker of the New Comet motor cycles, is now listing a little outfit of this kind. The engine fitted is a  $2\frac{3}{4}$  h.p. two-stroke Peco, which drives by chain and belt via a two-speed countershaft gear. The sidecar is the standard New Comet lightweight model, and is composed of a rectangular tubular chassis considerably underslung. Attachment to the cycle is at three points. The handsomely-shaped coachbuilt body is carried on C springs at the rear, while the foot is sprung on two coil springs. The general appearance of the little outfit is distinctly good.

Two other rather unusual sidecar chassis models are also manufactured by this firm, one being a special design suitable for the 4 h.p. Douglas, and intended for Overseas use. Four-point attachment is used, and it will be seen that the chassis, which is underslung, has double tubes on both sides, which adds greatly to the strength.

The New Comet lightweight sidecar outfit. The bicycle is fitted with a  $2\frac{3}{4}$  h.p. Peco engine and Albion countershaft two-speed gear.

The other model is intended for use with a double-seated body in connection with a high-powered twin. This chassis is somewhat similar to the one intended for the 4 h.p. Douglas, only the four points of attachment are rather different, being arranged in such a way that they are adjustable to suit any type of machine. It will also be noticed that all the main connections are attached to

the chassis at two points. The lower rail of the frame on the wheel side, instead of running parallel as in the other model, is carried up at an angle and assists in supporting the wheel axle. The chassis is thus triangulated on that side and should be extremely strong. The body is intended to be carried on C springs and shackles both front and back.

#### EXAMPLES OF NEW COMET SIDECAR CHASSIS.

(Left) Model designed for use with 4 h.p. Douglas machines, showing double side members of frame. (Right) New Comet chassis to carry two-seated bodies. Note how frame is triangulated to support wheel axle.

## THE GLASGOW M.C.C.

### TEMPORARY SUSPENSION OF THE CLUB'S ACTIVITIES.

**A** PROPOSAL that the club's activities be suspended for an indefinite period was carried *nem. con.* at the annual meeting of the Glasgow M.C.C. on Wednesday last week. The motion was submitted by Mr. John Gow, president of the club, on behalf of the committee, and a short *résumé* of the circumstances, supplemented by a few words from Mr. J. S. Fulton, convinced the meeting that there was no alternative. The club carried out a modified competitive programme last year with a fair amount of success, but since the end of the session

the membership has been still further depleted by the call to the Colours, and with the prospect of further enlistments in the near future it was felt by the committee that it would be unwise to attempt to "carry on," at least during 1916. The treasurer's financial statement showed the club to be in a sound position, and no subscriptions will be collected during the present year.

It was mentioned by the hon. secretary that 104 members had paid for 1915, which was considered satisfactory in view of the large number absent on military

duties. The retiring officials and committee were re-elected, to hold office until such time as they deem it advisable that the club's activities should be resumed. The office-bearers are: President, Mr. John Gow; vice-presidents, Messrs. J. S. Fulton, G. H. Cutbush, G. W. Orr, and the Rev. Dean M'Nairney; captain, A. R. Fraser; vice-captain, G. Wilson; hon. secretary, E. W. Thiem, Windsor Hotel, Glasgow; hon. treasurer, W. Muir, 20, Monteith Row, Glasgow; committee, Messrs. W. Hood, G. Thomson, J. L. Dykes, and F. Miller.

A "Clutch and Countershaft" type, with Kick Starter, Positive Locking Clutch, longest Belt Drive, and the Gradua Gear.

## THE RESTRICTED SUPPLY OF PAPER.

How readers of *The Motor Cycle* can assist in effecting the necessary economy.

IN view of the proposed restriction by the Government of the supply of paper, readers of "The Motor Cycle" can render valuable assistance to the Publishers by making a point of always purchasing their copy from the same place, or, better still, by giving a definite order to a newsagent for the regular supply of the journal each week. If this plan is adopted generally a considerable economy of paper will result, for newsagents will be better able to gauge their requirements, and will be left with fewer unsold copies, which are, of course, wasted.

*Kindly fill in this form, cut out and hand to your newsagent.*

### ORDER FORM.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and the replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" on the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Armature Rubbing Field Magnets.

**?** Will you please tell me whether the efficiency of a magneto is seriously interfered with if the armature rubs very slightly against the field magnets?—M.M.

We do not think that the sparking efficiency would be greatly affected, but there is no doubt that the armature rubbing against the field magnets would eventually cause considerable damage to the machine in general, and the heat generated by the friction would probably destroy the insulation of the armature.

## Refusal to Start.

**?** My  $3\frac{1}{2}$  h.p. single-cylinder 1913 model has never been a machine which would start easily. When the engine is cold I have to run twenty yards or so before it fires, but if warm it fires in from four to six yards. Can you give me remedies for starting easier?—S.E.

To obtain easy starting, the chief thing is to have all adjustments correct. Make sure there are no air leaks between the carburetter and engine. Plug points should be clean and separate about  $\frac{1}{32}$  of an inch; the contact points should separate .4 mm., or, roughly, the thickness of a visiting card. Always start with the spark as far advanced as possible, as the magneto gives the hottest spark when in this position. Do not give too great a throttle opening—about one-third is sufficient—and close the air. A small amount of petrol injected through the compression tap will usually facilitate matters in cold weather.

## Valve Timing.

**?** I would be obliged if you would tell me the best timing for the valves of my  $3\frac{1}{2}$  h.p. single-cylinder.—D.E.

You will find the following valve setting to be about correct for all ordinary touring purposes. Make sure the exhaust valve closes when the piston is exactly at the top of its stroke. The inlet should then open immediately after, and close just after the piston has begun to rise. The design of the cam will automatically arrange that the exhaust valve will open at the correct moment, which, as a rule, will be found to be about  $\frac{1}{4}$  in. from the bottom of the firing stroke. We would recommend you to obtain a copy of "Motor Cycles and How to Manage Them" or "Tracing Troubles," price 1s. 4d. and 1s. 2d. respectively post free from these offices, in which you will undoubtedly find much information which will be of use to you.

## Naphtha as a Fuel.

**?** I run a 6 h.p. Enfield sidecar combination. Now that petrol is such a price, I should be obliged if you would tell me if naphtha used alone or a mixture of half petrol and half naphtha would do any damage to the engine. Would the carburetter, which is an Amac, have to be altered in any way? I know one or two motorists who are using a mixture of half paraffin and half petrol.—A.S.

The usual result of using any spirit or mixture other than petrol or benzole is the rapid fouling of the cylinder and piston, and frequently rapid wear of the cylinder and sometimes other bearings, owing to the impoverishing of the lubricating oil caused by only half vaporised fuel. Provided the carburetter is accurately adjusted, and ample heating of the vaporising chamber as well as the incoming air is provided, quite satisfactory results can be obtained from mixtures of about 50% petrol and paraffin. The same would apply to naphtha, though, we believe, the latter is rather more expensive. With a 50% mixture fairly easy starting can be obtained without injecting or first running on petrol, while the usual trouble of knocking when running on pure paraffin is considerably reduced. If

a greater proportion of paraffin is used very great difficulty in starting will be experienced, and trouble by knocking and very rapid fouling of the cylinder and piston will be prevalent.

## Magneto for Vertical Twin.

**?** Would you kindly tell me what the firing angle of a magneto should be for a twin-cylinder with vertical cylinders?—J.S.

For a vertical twin a magneto similar to that used on the Douglas, viz., one firing at  $180^\circ$ , is required, but the method of running it depends upon the crank setting. If both cranks go up and down together, the explosions are quite even, i.e., one explosion each revolution. It will, therefore, be necessary to run the magneto at half engine speed. If, however, the cranks are set at  $180^\circ$ , viz., one up and one down, the explosion will occur at uneven intervals, the two explosions taking place both in the same revolution of the crank, a long interval, occupying a complete revolution, taking place before the next two explosions. In this case it is necessary to run the same magneto at engine speed. This setting will ignite the mixture correctly, but two idle sparks will take place at the top of each exhaust stroke. This, however, will in no way affect the running.

AT A NEW ZEALAND TRAINING CENTRE.

A 6 h.p. Royal Enfield and sidecar at the Territorial Camp at Oamaru, North Island, where it has been used by its owner, Raleigh Ginsberg, in his despatch riding work.

### Loss of Power.

I have a 6 h.p. twin combination which until lately went well and carried three easily. About three months ago I had it taken down, since when I have used it very little. I now find it has lost power very considerably. I have cleaned the carburetter, and all other points seem to be all right. It knocks badly on hills now, and will not climb those that it used to take easily on top.—G.H.S.

It is possible that your loss of power is due to any of the following: The piston rings may be jammed in their grooves with carbon deposit and require freeing. Insufficient lubrication will also cause loss of power. Make sure your valves are seating properly and that the clearance between the tappets and valves is not too great—4 mm. would be about correct. The valve springs may have lost some of their original strength. Make sure the silencer is not choked and so causing back pressure and overheating. Also make quite sure the carburetter is thoroughly clean. We think if you attend to all these adjustments you should regain the lost power.

### Materials for Brazing.

I am anxious to build a motor cycle to my own ideas, so would be glad of the following particulars. (1.) Would one or two small blow lamps, such as are used for removing paint, be of any use for brazing? (2.) What materials do I require for brazing, and how is it done? (3.) What sort of fit has a tube to be in a lug before brazing? (4.) What heat should a tube be heated to before bending is attempted?—F.M.

(1.) No. You require a large paraffin brazing lamp, or a gas blow pipe specially made for the purpose. (2.) To make a satisfactory job of brazing much practice is needed. Great care has to be taken not to get the metal too hot and so burn it and weaken the joint. At the same time sufficient heat to cause the brass to run thoroughly must be applied. The materials needed are either a gas blow pipe or a paraffin brazing lamp; a forge with asbestos cubes, in order to concentrate the heat in the required place; a supply of brass wire or spelter, and a brazing flux such as Boron composition—borax is also used. The parts to be brazed are thoroughly cleaned, and, if necessary, pinned in position, then placed in the forge, and the asbestos cubes packed all around the points to be joined. The heat is then applied, and when the parts have obtained a red heat some of the flux should be applied with a brass wire. It will then be found that directly a sufficient heat has been attained the brass wire will melt and run around the joint. While the parts are still red hot the joint may be brushed with a wire brush to

## THE MOTOR CYCLE

### ANNUAL SPRING NUMBER

WILL APPEAR ON  
**Thursday, April 13th.**

remove any undesirable brass. This will save much time in filing after the article has cooled down. (3.) It should be a good tight fit, and also pinned before brazing. (4.) To bend a tube without a proper tube bending machine, it should be filled with sand, and the two ends plugged with wooden plugs, and then heated at the point where the bend is required to a red heat, taking care that it is heated evenly all round. Care should be taken that the tube is not heated to a greater heat than is absolutely necessary, otherwise it may be burned, and the strength greatly impaired.

### Two-stroke and Passenger Work.

I am thinking of purchasing this season a 2½ h.p. two-stroke and sidecar, but before finally deciding I would like your opinion as to whether the machine will have power enough to take my wife and myself up any ordinary gradient, such as one meets on the usual roads. I do not intend any freak hill-climbing. I may say I only weigh just on eight stone; my wife weighs, if anything, a trifle less. If the load is all right, would it be ill-using the machine to take occasionally a passenger on the carrier? The engine I propose is a 2½ h.p. two-stroke Peco, 75 mm. x 79 mm. bore and stroke.—M.B.

If fitted with a two-speed gear there is no reason why you should not take a light sidecar on main roads quite satisfactorily with the engine you mention. The usual objection with passenger light-weights is that the frame is not sufficiently strong to withstand the extra side strain. We would not advise you to carry a third passenger on the carrier. There are several machines of this power now on the market intended for light sidecar work.

### Shortening Magneto Chain.

Will adjusting the magneto chain by removing the half link upset the magneto timing?—A.S.

If the magneto chain is so long that it is possible to remove half a link, it would be advisable to do so, but care will have to be taken not to alter the magneto timing. Provided the half link is taken from the non-driving side of the chain, no alteration to the timing will

take place. Before removing the link you should carefully mark the positions of both the magneto and the engine, and when replacing the chain be sure to put it in exactly the same position. If, however, there is only a small amount of slack you will probably find that this can be taken up by simply moving the position of the magneto. After making the adjustments it would probably be as well to check the timing, as if the chain has stretched so much as to require a half link taking out, this may have become somewhat retarded. With the ignition lever two-thirds retarded the spark should occur when the piston is on the top dead centre.

### EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

“L.N.P.” (Edgbaston).—2½ h.p. Allon two-stroke. Reliability, speed, hill-climbing, consumption, and sidecar capabilities.

“F.J.S.” (Devon).—Binks carburetter and spirit. Power, consumption with sidecar, effect on engine, and general efficiency.

### RECOMMENDED ROUTES.

TRURO TO NEWBURY.—F.M.

Truro, Ladock, Bodmin, Launceston, Okehampton, Exeter, Honiton, Chard, Wincanton, Amesbury, Andover, Newbury.

MANCHESTER TO SWINDON.—T.F.C.

### PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

In view of the decision of the Government to limit the import of material for the manufacture of paper it is imperative that every possible step should be taken to avoid waste of paper in any form. It has been the custom in the past for newsagents to order a certain number of papers for chance sales, and these copies if unsold become what are known as “returns”; in other words, waste copies.

In the case of “THE MOTOR CYCLE” the percentage of returned unsold copies has been remarkably low, but in order to conserve the supply of paper in future it is desirable that the waste of copies, ordered to accommodate occasional purchasers, shall as far as possible be eliminated.

Readers of “THE MOTOR CYCLE” are urgently requested to assist in this matter by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

# Will your tyres Stand much of this?

## The answer !

Granby Villas, Bingham, Notts.

Dear Sirs,—I think it only fair to say that your Special Heavy Cover is marvellous. I have been running one on my driving wheel for thirteen months and have ridden considerably over 6,000 miles. I use my machine practically every day, fair weather or foul, winter and summer, and as much of the riding is at night over roads that are not steam-rolled, and generally covered with loose stones, I consider that your tyre has emerged triumphantly from a most severe test.

You are welcome to use this letter as you may wish.

Yours truly (signed), F. P. GENT.

# TRACING TROUBLES

## Third Edition

Revised and brought up to date.

**MOTOR CYCLE FAULTS,  
THEIR IDENTIFICATION  
AND THEIR REMEDIES  
SIMPLY AND FULLY  
.. .. EXPLAINED .. ..**

**T**HIS handy little volume deals with all the faults to which motor cycles are liable, explains how they can be easily diagnosed, and shows how they can be rectified. Every conceivable cause of trouble is dealt with, and the remedy for it carefully explained. It is written in simple language by a practical motor cyclist of long experience, and fully indexed for ease of reference.

- ¶ The Third Edition of this handy book for motor cyclists is now on sale.
- ¶ All obsolete matter has been taken out, and new matter added to bring it up to date.
- ¶ The Section dealing with Two-stroke Motor Cycles has been considerably enlarged and rearranged.
- ¶ A new section dealing with Electric Lighting Dynamos has been added.

## AMONG THE ACCESSORIES.

### A Useful Helmet for the Rainy Season.

A GOOD form of head-dress for wet weather has been placed on the market by Messrs. the Service Co., Ltd., 289-293, High Holborn, W.C. It

The Service Co.'s oilskin helmet.

is composed of thin oilskin, and is lined with woollen material. Ear holes with the necessary flaps are provided. Motor cyclists will much appreciate a helmet of this kind when cold winds and heavy rains are prevalent.

### Footrests and Handle-bar Grips.

MOTOR cyclists who favour pillion riding know how uncomfortable it is not to have anywhere to place the feet. To get over this difficulty Messrs. Brown Bros. have introduced special footrests to be attached to the

Brown Bros. footrests.

chain stays of a motor bicycle, which are suitable to be fitted to either round or D shape tubes. This considerably adds to the comfort of those who ride on the back carrier of a motor bicycle.

To obviate the occasional vibration which is perceptible on the handle-bars

Rubber handle grips to absorb vibration.

of a machine, this firm also specialises in rubber handle-bar grips built up on steel casing. These are extremely pleasant to hold, and certainly absorb a considerable amount of either.

### Three Useful Accessories.

A FIRM which is not as yet well known to the motor cyclist, but is devoting special attention to his needs, is that of Messrs. Etienne et Cie., who have placed on the market two very useful motor cycle watches in watch cases of British manufacture. Of these, one is heart-shaped, and is of attractive pattern, while the other, which is round, is provided with a luminous dial.

Yet another useful accessory sold by this firm is an electric pencil. When the pencil is pushed upwards the light is switched on, and is directed on to the paper on which the owner is writing.

Two watches and an illuminated pencil—two useful accessories for the motor cyclist sold by Etienne et Cie.

### The Splitdorf Dynamo Magneto.

THE Splitdorf dynamo-magneto has become known in connection with the Indian motor cycle. The machine contains two armatures; the upper one, used for lighting purposes, runs at engine speed, the sparking armature at half engine speed as usual. As the magnets are not permanent, they have to be excited by current from the battery, which is passed through the shunt coils of the dynamo by revolving the machine a few times with the kick starter; this causes a small contact, controlled by a centrifugal governor, to be brought into action. At a speed of about 30 m.p.h. (1,400 r.p.m.) the generator produces a current of 3 amps.  $7\frac{1}{2}$  volts, and a suitable fuse is contained in the circuit. Should the battery become discharged the lamps can be lighted direct from the generator, when running at moderate speeds. The set comprises a 6 c.p. head light, a 2 c.p. tail, and an electric horn.

Motor cycle equipped with the Splitdorf dynamo-magneto igniting and lighting set. The instrument itself is shown enlarged resting on the saddle.

### A Pair of Footrests and an Exhaust Whistle.

RIDERS of old pattern machines are often anxious to improve them by the addition of footrests, and for

Footrests marketed by J. Grose, Ltd.

this purpose Messrs. James Grose have placed on the market a useful set of rubber-covered footrests, which are sold at a very moderate figure.

Another of their specialities is a very well-made exhaust whistle, known as the Throstle. One of its chief attributes is the fact that it is practically self-cleaning, the valve employed being a type of slide, the opening of which keeps the most important parts free from carbon deposit.

Grose's exhaust whistle.

### The Spitler Puncture Plug.

A NEAT and handy metal puncture-sealing stud is the Spitler puncture plug, sold in England by Messrs. Watts and Co., of West Ealing. This stud consists of three parts, viz., a disc with a screw, a recessed cap which fits over the screw disc, and a lock-nut. The screw disc is inserted through the puncture, which should be slightly enlarged if necessary. The cap is then placed on top and the whole locked together by the

lock-nut, which is tightened by a special key. It is claimed that the stud makes an absolutely permanent repair. There is no doubt that this method of repairing would be a great boon in the wet or on a dark night.

### Tyre Deliveries.

The Palmer Tyre, Ltd., inform us that it has now a stock of the 3in. cord tyre in the three-rib, combination, and steel-studded patterns for private users. Previously some delay was caused through military claims, but the company is now able to keep pace with those requirements.

### Benevolent Fund Handbook.

We have received from Mr. A. J. Wilson a copy of the 1916 handbook of the Cycle and Motor Trades' Benevolent Fund. The good work done through the agency of this fund in a quiet and unobtrusive manner is well-known throughout the motor and cycle trade, and a glance at this new handbook impresses one with the strength and activity of those responsible for the direction of the fund's activities.

A well made tail lamp sold by H. Taylor and Company, Limited, of Store Street, Tottenham Court Road.

### A Useful Booklet.

We have received from the Enfield Cycle Co., of Redditch, "The Book of the 3 h.p. Royal Enfield," fourth edition. This contains full instructions for running the machine named, a complete list of parts with prices, including those of magneto and carburetter, and many useful hints and tips. A copy will be sent to any rider of the 3 h.p. Enfield on application.

### Motor Cycle Trade with Russia.

The Russo-British Trade Exchange, Ltd., 16, Regent Street, S.W., a society for the promotion of trade between Great Britain and our Russian Allies, informs us that it is at all times willing to give British manufacturers of motor cycles and accessories information concerning Russian commerce, regulations, and tariffs.

### The Result of a Serious Collision.

The sidcar chassis shown was constructed by Messrs. Robertsons Motors, Ltd., and was attached to a Harley-Davidson motor bicycle. As will be seen, it has had to withstand a pretty severe impact. Thanks to the joints being made on the acetylene welding process, these are absolutely intact and uncracked, whereas if brazed joints had been used far more serious damage would have been done.

A Robertson sidcar chassis after a serious collision, showing what a small amount of damage was done owing to the welded joints.

### A Novel Valve Grinder.

The makers of the Ariel motor cycle have introduced a new type of valve grinder which is made suitable for use with both the 3½ h.p. single and 5 h.p. twin Ariel engines. The valve cap is

removed, the grinder takes its place, and the valve is rotated through the top of the grinder by means of a piece of stout twine or thin cord.

### Catalogues Received.

James Grose, Ltd., 4, Old Jewry, E.C. An extensive catalogue of motor cycle accessories of all kinds and types.

New Imperial motor cycles. In this publication there is contained much information concerning the New Imperial light tourist motor cycle. New Imperial Cycles, Limited, Princip Street, Birmingham.

### Treasury Note Cases.

The makers of Pedley tyres are making a special offer to purchasers of Pedley belts or motor cycle tyres during the last two weeks of March. The inducement consists of a neat morocco leather Treasury note case, which is presented free to every purchaser of the goods stated.

We are also informed by Messrs. J. Pedley and Son, Ltd., that they have now taken over the whole of the premises situated at 30, Holywell Lane, Great Eastern Street, E.C., which they lately held in conjunction with another concern.

### Reviews.

"Indian Motor Cycles, 1916." A publication worthy of the well-known Hendee firm. The illustration depicting a part sectional model of the Powerplus engine is particularly worthy of mention. The same also applies to the sectional picture of the two-stroke. The Hendee Manufacturing Co., Ltd., 366-368, Euston Road, N.W.

"Penzance and the Land's End District." (The Homeland Association, Ltd., 37-38, Maiden Lane, Covent Garden, W.C. 6d.) This is a useful guide book, written by a number of authors interested in the locality, each specialising on the subject on which he writes. The account of the antiquities, in which West Cornwall is particularly rich, is in every sense adequately dealt with, while the book also contains an excellent map of West Cornwall and a plan of the town of Penzance.

"Clubs, 1916." E. C. Austen Leigh. (Spottiswoode and Co., New Street Square, E.C. 5s. 4d. post free.) A list of over 4,000 clubs frequented by Englishmen in all parts of the world. Over 1,500 golf clubs are included. The information, we notice, is not always up to date or accurate; for example, the A.C.U. has no secretary according to this list, while neither the R.A.C. nor A.A. and M.U. has any object in life. In addition, the R.A.C. subscriptions mentioned are out of date.

The Kempshall 700×85 mm. non-skid cover, which is designed to fit 650×65 rims. The anti-skid Kempshall cover is slightly different in design, as will be gathered from an illustration published in our issue of February 17th.

"Complete Hints and Tips for Automobilists." (Iliffe and Sons Ltd., 20, Tudor Street, E.C. 2s. 6d.) A new edition of this useful book has lately been published. It consists chiefly of a reprint of the most valuable hints and tips which have appeared in *The Autocar*—a feature which has been very popular since it was first introduced in 1902. The new edition has been very fully revised and brought thoroughly up to date. Notwithstanding this fact, hints and tips which are likely to be of use to owners of out-of-date cars are still retained. A fresh feature is the section devoted to dynamos, accumulators, and electric lighting outfits generally for the motor car.

The **ONLY BELT** for Gradual Gears.

THE  
"ZILLA" BELT  
LEATHER & RUBBER.

**UNBREAKABLE:** Because the whole pulling strain is taken by a steel chain core, manufactured to withstand from 3 to 4 times the pulling strain of any motor cycle yet built.

**NON-SLIPPING:** Because the leather and rubber washers on the chain have 50% greater driving surfaces than leather or rubber belts, and the combination of leather and rubber will grip the driving pulley in any weather.

**FASTER DRIVE:** Because the washer and chain construction gives a flexibility which allows the Zilla Belt to "hug" the smallest pulley without that great internal friction and force required to bend an ordinary belt round it.

**JUST THE THING FOR SIDECAR WORK,** especially in changeable weather or in exposed positions.

THE LODGE SPARKING PLUG CO., LTD.,  
BIRMINGHAM and RUGBY.

## Stewart MOTOR CYCLE SPEEDOMETER

## AN ESSENTIAL EQUIPMENT.

Consider the great risks you run in riding without a reliable speedometer, consider the numerous advantages of having a perfect speed and mileage indicator on your motor cycle, and then—give an order for a "Stewart," the best speedometer that money can buy.

You'll save its cost in next to no time, in fines saved and economies effected, while as to the pleasure it will give, that is a benefit which cannot be measured in money. Absolutely accurate, needle steady as the hands of a watch, and it registers from Zero to 75 miles per hour.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the production of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

## OVERSEAS TRADE.

**MOTOR CYCLE MANUFACTURERS' EXPERIENCES OF DIFFICULTIES CONNECTED WITH THE EXPORT TRADE. SOME ILLUMINATING FACTS FOR THE BOARD OF TRADE. THE DIFFICULTIES OF THE GOVERNMENT.**

**T**HIS subject is one which we have been dealing with for some time past. Our sole endeavour has been to foster British trade and improve the existing conditions for the export of motor cycles, not only in respect to the more ready collection and transport of goods by rail, but also to expose the delay at the docks and the time required to obtain licences from the Board of Trade to export goods to neutral countries. It will be well within our readers' memory that the Government have for some time past wisely exhorted manufacturers to concentrate on overseas exports with a view to preserving our balance of trade, imports at the moment exceeding by a 1.52 to 1 ratio the value of British exports. Motor cycle manufacturers have naturally, in common with others, done their utmost to carry into effect these requests, and, consequently, it is all the more irritating to them to find obstacles placed in their path. The matter became so serious and complaints so rife that we drew the attention of the Board of Trade to it, and received a reply requesting us to furnish the department with particulars of specific instances of delays which have occurred. A fortnight ago we mentioned this fact in these columns, inviting manufacturers to provide us with the necessary information, and we must express our thanks for the evidence furnished, which is an overwhelming proof that complaints are by no means unfounded. We may now express the hope that the Board of Trade will be able to bring about improved conditions—we recognise that the task is no easy one in view of the tax upon all modes of transport occasioned by the world-wide war—and so facilitate the

export of British-made machines. By so doing, not only will much-needed gold be brought into this country, but British trade connections will be preserved which will prove invaluable when peace returns. Undoubtedly if the Board of Trade is able to effect a general improvement the volume of export trade will increase, as manufacturers will be encouraged to do their utmost to concentrate on orders from abroad, whereas at present their zeal is damped by the obstacles encountered. These obstacles cannot be swept aside in a week, nor can they be wholly condemned, but in face of Government appeals to increase our exports, it is time that the matter should be ventilated.

We quote a few typical extracts from letters we have received from manufacturers, from which it will be seen that the difficulties in the way of exports mainly apply to neutral countries. The same difficulties do not exist when British possessions are concerned, licences to export not being necessary with our Colonies.

**Royal Ruby Cycle Company, Ancoats, Manchester.**

"We think it is quite time that something was done regarding the export trade of the country, and there is no doubt it would be very advantageous if some arrangements could be made whereby the material required for goods for export could be obtained with greater ease, and also that some facilities should be given to firms to clear these goods quicker than has been done since the war commenced.

"As regards the granting of licences. In one or two cases we have had great difficulty in getting these in reasonable time; but we are pleased to say that the last licence we wanted we obtained very quickly, but we think the reason of this was that the machines were without tyres. We experience the greatest difficulty in getting the goods away when ready. It often takes us weeks to get the goods removed from here, and then we find when

**Overseas Trade.—**

they arrive at the docks that they are shut out from the boat, and have to wait until they can get cleared.

"We have a case now as under:

"For instance, on January 12th we handed the railway company here seven cases of motor cycles for shipment to New Zealand. They were sent to Liverpool to catch the s.s. *Olaki*, and although they were there quite a week or ten days before the boat sailed, for some reason or other these goods did not get taken on board. When they missed this boat in Liverpool we asked the shippers, Messrs. James Dowie and Co., 15, Water Street, Liverpool, to have them sent on to catch the next boat from London, and although they assured us that they made every effort they could to get the goods away, they were unable to get the railway company to take them from Liverpool to London. Consequently, the goods have been lying in Liverpool ever since, and we are hoping that they will be put on board the s.s. *Middlesex* some time next week."

**The Triumph Cycle Co., Ltd., Coventry.**

"The difficulties in obtaining licences to export motor cycles abroad, and also the difficulties in the way of transit, are very great. As regards the licences, we experience the greatest difficulties in obtaining permission to export machines to neutral countries. We do not think that we have a right to complain about this.

"As regards the railway companies, we have experienced some difficulty ourselves; but here again we understand that it is simply on account of the preference which Government orders must necessarily have."

**Hobart Bird and Co., Ltd., Coventry.**

"Prior to the war we were developing trade rather extensively throughout Holland, and for the past two months we have had a large number of our two-strokes prepared ready for shipment to that country, but we have not been able to obtain the necessary permit from our War Trade Department. We know that other manufacturers are experiencing the same trouble with regard to Holland, but the particular agent who is representing us has already had his books thoroughly examined by an accountant from the British Consulate, so that in this particular instance there should be no reason for our not shipping machines to him.

"Respecting Denmark, we were kept about six weeks without the necessary licences, but these have just come to hand, but it is a matter for regret that such time should elapse. Perhaps, however, with your assistance matters may be much improved."

**Douglas Brothers, Kingswood, Bristol.**

"We thank you for the attention and publicity you intend giving to a matter that should interest manufacturers in general.

"We cannot supply you with any information, as we have not experienced anything but the ordinary business delays in obtaining permits for shipping goods abroad.

"We believe, however, that there is some difficulty encountered, and with which to a great extent we agree, when permits are required for shipping machines to foreign countries, but we are very pleased to be in a position to say that our export trade at the present moment is done exclusively with British Colonies."

**A Birmingham Manufacturer.**

"Frankly, I cannot for the life of me understand the present extraordinary conflicting action on the part of the Government. Only a fortnight ago Mr. Asquith was emphasising the importance of increasing exports, yet, in spite of this, it is next to impossible to get goods shipped, and the difficulties put in the way of manufacturers as regards production are most serious. During Christmas week an order was cabled to us for one hundred machines from a new-firm, but we had to turn it down.

"Trade or no trade, it appears to me that the authorities regard the motor cycle merely as a *matter of luxury, and of no consequence whatever*, and that all machinery capable of making motor cycle engines should be on munition work. So far as I can see, our politicians do not recognise the value to the country of the goodwill of the industry.

"Where British manufacturers cannot supply, the Colonials must, in order to earn their daily bread, take American machines, and when the American is once in

there are reasons, and substantial ones, that make it difficult for the trader to go back to the British machines when the British manufacturers may be able to supply.

"I think it must be recognised sooner or later that the motor trade as an industry has probably been able to render almost greater service than any other industry, but our goodwill is suffering in consequence.

"There are plenty of luxury trades, particularly in this city, which industries have not probably rendered any service at all to the country, but they are allowed to go on as usual, whereas this industry, which renders good service, is handicapped in every possible direction."

**W. H. Whitehouse and Co., Friar's Road, Coventry.**

"We have certainly experienced delays in all of the directions you mention, but by what we might almost term a coincidence the whole of these have now been removed. We have obtained all the licences for which we have applied, and the railway company in turn has accepted the whole of the delayed traffic, so that possibly your efforts are already commencing to bear fruit."

**Hendee Manufacturing Company.**

"We have exported quite a few British-made sidecars, and really had no particular difficulty in getting them despatched.

"Where we are held up is on the question of tyres. We seem to be unable to obtain licences to ship tyres either to Sweden or Denmark."

**W. J. Green, Ltd., Croft Road, Coventry.**

"So far we do not think we have any cause for complaint in the question of licences for export of motor bicycles or delays in transit. There may have been an isolated case, but, generally speaking, no interruption of business. At the same time we may add our appreciation of the efforts you are putting forward in the interests of the trade."

**Tozer, Kemsley, and Fisher, Ltd., 84, Fenchurch Street, London, E.C.**

"The bulk of our motor cycles are shipped to the British colonies, consequently export licence is not necessary for these. We do no business in Europe, but when shipping motor cycles to Japan, Siam, and Java, we always have to obtain licences, and find we can obtain these without much difficulty or delay. We know transit difficulties have occurred."

**The Sun Cycle and Fittings Co., Aston Brook Street, Birmingham.**

"Up to the present we consider that we are fairly fortunate in getting licences, although there is bound to be delay, but we make no complaint, as, in our opinion, it is necessary for the Government to make all the enquiries they think proper in the interests of the country generally.

"The only difficulty that we have at the moment is that we have orders and actual money to the extent of £250 for motor cycles for shipment to Sweden, and, although our customer has got the necessary documents declared by the British Consul and the local Chamber of Commerce, we cannot ship these goods, as the War Trade Board will not issue a certificate on account of an arrangement made with Sweden that Sweden allows us to ship an equal quantity of goods through their country into Russia—a *quid pro quo* which, in our opinion, is one that we cannot complain against, and is in the interests of the Allies generally at the present time."

**A. J. Stevens and Co. (1914), Ltd., Wolverhampton.**

"It has been no uncommon thing for a period of five weeks to occur between the date of our application and the granting of the licence; on the other hand, in numerous instances we have received the grant within a week or ten days, and the latter experience tends, in our opinion, to show that there is much unnecessary delay and disorganisation in the department responsible for the issue of these licences, even after making due allowance for the fact that certain applications require more careful consideration than others. However, provided that application is accordingly made sufficiently in advance of the required date, this particular point does not appear to us to be serious when compared with the question of rail and dock delay.

"At our particular centre the latter trouble has assumed very serious proportions during the last two months, and

**Overseas Trade.—**

if it increases it will virtually mean the extinction of our export business. As a case in point, at the present moment we have a consignment of motor cycles which has been awaiting acceptance by the rails for either Birkenhead or London Docks for the last month or more, and daily efforts to get these carried, by any one of three railway companies, for numerous vessels, the names of which have been duly passed to us by the shippers, have so far been without result! The docks are either 'entirely closed,' 'closed for all but war traffic,' or else 'No! The ss. — is not on our list!' Meanwhile, the money is standing idle, the foreign or colonial agents in question are losing their orders, and our hold on our Overseas trade is slipping from our grasp. More often than not nowadays the rails state that they cannot carry for the vessel whose name the shippers have passed to us, and after a week of futile efforts, the name of a fresh vessel will be passed to us from the shippers, with the information that 'this vessel is now loading at the — docks,' but fresh efforts on our part are, as likely as not, no more successful than before, and one can readily imagine the state of congestion which can rapidly arise in the packing department as export cases multiply for weeks through this trouble. We could, moreover, quote instances which go to prove our contention that the rails alone are often to blame in the matter."

**Humphries and Dawes, Ltd., York Road, Hall Green, Birmingham.**

"It takes upwards of a month for the War Trade Dept. to say yea or nay to an application, and in one case for exportation to a neutral country they have just refused us a licence for some thirty odd machines, although why they should do this with our goods we do not know, since the British war authorities say they are not the slightest use to them for war service, and do not patronise us.

"We may say our Dutch agent has offered to keep records and numbers of machines as to where every single one is sold, and further we believe the Netherlands Overseas Trust extract from possible importers a deposit of some hundreds of guilders as a precautionary measure against any breach of faith."

A leading manufacturer who prefers to remain anonymous writes: "On March 14th we received an official order from the Netherlands Overseas Trust for a quantity of sidecars to go to our agent in Holland.

"We have the sidecars all ready to despatch, but are unable to obtain application forms for export licences from the War Office Board of Trade, their excuse being that they are entirely out of them, and do not know when they will have any more from the printers. This is certainly a nice state of affairs."

## A MOTOR CYCLE WEDDING.

Collier and Sons, Ltd.), and Mr. and Mrs. Mellano, of the Hutchinson Tyre Co.; while a congratulatory telegram was sent by *The Motor Cycle*. The motor cycle and sidecar shown in the illustration was a present from the firm to the bride and bridegroom.

After the ceremony Mr. and Mrs. Wensley left for Hastings, where the honeymoon will be spent. We wish them all joy and happiness.

ON the 15th inst., Miss Gertrude Collier, daughter of Mr. H. H. Collier, managing director of the manufacturers of the famous Matchless motor cycles, was married to Mr. Charles Wensley, at St. Margaret's Church, Plumstead Common. Miss Collier has worked for seven years in her father's office, and has proved herself invaluable. The wedding was entirely a motor one.

Among the guests were Mr. and Mrs. H. H. Collier, Mr. and Mrs. H. A. Collier, Mr. and Mrs. C. R. Collier, Mr. and Mrs. A. Walker (representing Messrs. H.

The motor cycle wedding of Mr. Charles Wensley and Miss Gertrude Collier. The start for the honeymoon on a Matchless sidecar outfit. Mr. H. H. Collier (inset) wishing the couple good fortune.

### Top Feed Carburetters.

"A Tramp" writes to emphasise a further defect in the average carburetter, on which petrol enters the float chamber at the top. The lid of the float chamber and the petrol union are both screwed joints, and "A Tramp" asserts that the screw threads of such lids are usually badly cut, and that, as it is generally difficult to screw up the lid to the same place every time it is dismounted, constant variations of jet level occur. It is bad practice—with so many duffers about—to employ double screwed joints, and top feed carburetters would be the better for spring clamped lids pegged into holes. But I do not know a single screwed lid with a bad thread, and deny the variation of levels which he suggests. So long as you do not cross the threads and screw the lid right home you get the correct level every time.

### Intermittent Sticking of the Bell Crank.

My experiences with intermittent sticking up of the contact breaker bell crank of a magneto have provoked a whole crop of parallels. Mr. J. W. G. Brooker has experienced it with a light car, and only traced the cause of his engine's starting reluctance when the bell crank finally stuck up for good. A long and interesting letter from Sgt.-Maj. Bernard Siffken—now unfortunately invalidated home from the Front—describes how his bell crank always sticks up in damp weather, but frees itself so regularly after a few attempts to start that he has never bothered to ease it. He adds that the trouble has not been at all uncommon in France with engines of all types and sizes, and endorses a staff opinion—from which I dissent very strongly—that the "baby" two-stroke is the best machine for winter despatch riding in Flanders. My own bell crank has been eased since I last wrote, and now functions admirably.

### American Advertising.

I have just read a booklet which—if I were a novice—would lead me to suppose there was only one sane motor cycle manufacturer in the world. Of course, it may be so, but I dare not award anything beyond the excellent Scottish verdict "Not proven" as yet. The firm in question sell a 1 h.p. two-stroke set for clamping inside the diamond frame of any push bicycle. I have not tried their set, so I must not dogmatise. But there would be several points on which I should require to be satisfied before I so much as rode it round a block. For example, is not the success of the Auto-wheel chiefly due to the fact that it dodges the need for strengthening a push bicycle frame before even the weakest motor set is fitted? If this is so, is it wise or right to advise fitting motor sets to push bicycles without qualification? Secondly, will even a 1 h.p. two-stroke engine run any appreciable distance on a

fixed gear of 10 to 1 without overheating? Or, if it will, how soon does the cylinder require decarbonising, and how does the warm little engine conduct itself on facing a long grade after, say, five miles of its alleged 25 m.p.h. on the level? Thirdly, is it quite accurate to imply that a buyer's choice is confined to selection between motor sets scaling 21 lb. and "ordinary motor cycles weighing about 250 lb."? Fourthly, is it even approximately true that any "petrol-lubricated" two-stroke is "practically free from oil and grease as compared with the regular motor cycle"? I ask these questions in all seriousness. The ultra-light-weight machine has fallen into discredit very largely because it could not behave itself on a gear low enough to make it genuinely roadworthy, and because the valves of wee four-stroke engines could not withstand prolonged hard work. If a lilliputian two-stroke will stand a gear of 10 to 1, half the troubles are solved immediately; with a 2 to 1 reduction on the chain, we only need a 5 to 1 reduction on the belt; and a pulley of the indicated diameter, coupled with the even torque of a two-stroke engine, makes an encouraging proposition. But—geewhizz—if I set any two-stroke engine in my acquaintance to run ten miles on even a 7 to 1 gear, the thermometers in the whole of the county would go up ten degrees apiece; why, my present two-stroke almost welds its piston to its cylinder after not more than 600 yards up a test-hill near my house on a bottom gear of 8½ or thereabouts.

### Handle-bar Clutches.

I read Mr. Batten's notes under the above title with great interest, but hardly thought he was sufficiently judicial. He is all for the handle-bar clutch control, as I am myself, but he did not state the factors which limit my own enthusiasm. Almost any old handle-bar control will do for a sidecar, because the machine is self-balancing, and as a consequence the slight temporary derangement of the steering, inseparable from handle-bar control of bad leverage, does not really matter. I doubt if Mr. Batten realises this point, because he happens to use a machine which has excellent clutch leverage; but I am slow to praise handle-bar control unreservedly, because so many makers are utterly ignorant of the simplest laws of leverage, and a handle-bar clutch on a heavy solo machine is a fearful nuisance unless the leverage is good, and the touch proportionately light. Give me a light handle-bar control, and I will esteem the man who praises foot control a raving lunatic; experience of stiff h.b. clutches is solely responsible for the survival of pedals, which are intrinsically wrong, stupid things. Brake pedals would have passed out of vogue years ago if only nature had endowed us with an extra hand.

## AMATEUR REPAIRING.

### How Two Brothers Overhauled a Second-hand Mount.

THERE must be many readers of *The Motor Cycle* whose interest in the pastime is not confined to purchasing a brand new model every season. There must also be a large number of comparatively young riders who are able and willing, nay, prefer to enjoy motor cycling without kick starters and electric equipment, or even speed gears and free engines. These excellent and respectable devices, though admirable in themselves, seldom fail to detract from the charm of a machine in the eyes of the young and enthusiastic.

It is principally for this class, whose heads are better stored with brains than their pockets with money, that the author gives here a short account of what he did to a particular machine in the way of repairs. Be it noted that no special tools or even a good supply of ordinary ones were used. A few spanners, screwdrivers, large hammer (most useful of "inducers"!), a hacksaw, and two or three files were the principal items in the outfit: the want of a vice was greatly felt, but many curious domestic fittings, such as an old broken grate bottom and a fender, were taught to act as substitutes, and held all manner of shapes during the work.

#### First-class Condition!

The motor cycle in question was a 1913 T.T. Ivy with a  $3\frac{1}{2}$  h.p. overhead valve Precision engine. It was obtained from a dealer in second-hand machines for another machine and a small cash payment in the usual manner. It was briefly described as being in "first-class condition." Having had a certain amount of experience with dealers, the author was under no illusions as to what to expect. Being on sick leave and having plenty of time to take the machine in hand, he was not dismayed at the state of affairs which is here briefly described:

ENAMEL.—A few islands in a sea of dirt and rust.

PLATING.—Fairly good.

TYRES.—Both quite worn out, canvas showing.

BELT.—Worn out.

ADJUSTABLE PULLEY.—Worn out.

FRAME.—Cup containing ball race at top of steering head cracked, evidently by the thrust of the spring forks. This cup was an integral part of the frame, and its being cracked allowed over  $\frac{1}{2}$  in. backward and forward play.

ENGINE.—Gudgeon pins and little ends worn out; one big end (the central one, working between the forked end of the other rod) with cracked bush. Several crank case bushes, including pulley side main bearing, loose and rotating in their bosses.

In general, nearly everything possible was loose and out of adjustment, and many small fittings were either lost or ruined.

#### The Work Commenced

In spite of this somewhat alarming list, the machine had plenty of good stuff in it, and seemed well worth the money.

It was decided to do the job thoroughly, and to avoid all patching up. The pleasure of riding would be greatly enhanced by knowing everything had been thoroughly done, even though it meant a long delay. The evening of the Ivy's arrival saw the

author and his younger brother reducing the machine to its lowest terms in parts, bolts and nuts, etc. This was done till nothing remained in its place save the spokes and belt rim, which were all right. Next all enamelled parts were cleaned of their remaining enamel and rust and dirt.

The old enamel was removed by means of Nameloff, a wonderful preparation, whose action is as powerful as its odour! It softens the enamel, which may then be taken off with a scraper in long strips. Emery cloth and "elbow grease" removed the rust, and finally all the parts were as shining silver. This accomplishment was only achieved after long and patient work: without Nameloff it would be next to impossible unless one were "doing time" and lacked other interests. The parts for enamelling were then painted with a dark red shade of Velure. This is very slow in drying, it was found, but it gives as brilliant a surface as stove enamel, and if well crossed is smooth and quite free from the thick, lumpy look of most amateur efforts. One coat is sufficient when properly applied: the surface is spoilt by a second.

Capt. J. B. Blaxland, the writer of the article "Amateur Repairing." His mount is a 1913 T.T. Ivy fitted with a  $3\frac{1}{2}$  h.p. twin overhead valve Precision engine.

**Amateur Repairing.—**

The tank presented the only difficulty. It had been resolved to panel this in the usual manner, the colours being dark red and cream. The panel outlines were marked with indelible pencil on the tin, and then one colour was applied so as to reach exactly to the lines. Any mistakes were corrected and wiped clean at once. With patience and a steady hand it is not difficult to get a very good line this way. When the first colour had dried the other was applied in the empty spaces. No mistakes were permissible or there would have been a blotchy appearance. With care this ticklish job was successfully carried out, and the finish was very little inferior to the best professional work, though, of course, rather simpler. Transfers were obtained from the makers and fixed with hard varnish, and there was the completed article. Lining was not attempted, as anything but perfect work of this sort looks horrible, and, of course, many machines when new are not lined, yet look quite smart.

**Mending the Steering Head.**

When the parts were dry the machine was gradually and carefully assembled, many little details being attended to in the process, and every nut being scrupulously cleaned before being screwed up. The fractured steering head cup was repaired by a strong clip which was made from the old long exhaust pipe clip. This had to be carefully thought out and entailed much work, but anyone with commonsense would arrive at the solution, and it is absolutely sound and satisfactory after test. Its cost was *nil*, and it saved unbrazing the frame and fitting a new head. Several new clips for the silencer and long exhaust pipe were also made to replace small screws which were no use at all, and then the whole exhaust system was firm as a rock.

After some unavoidable delay, the engine parts that had been sent to the makers were returned repaired. The engine was then very carefully erected and timed and the whole power unit adjusted wherever

necessary before being inserted in the frame. All the controls were examined and the cables shortened and resoldered where necessary, and every little detail on the machine was thoroughly examined and adjusted. As there had been fitted two new tyres, a new belt, and new adjustable pulley, the appearance resembled that of a brand new model, and one had the satisfaction of knowing everything to be sound and satisfactory.

The final delight was that the little twin got into its stride immediately, the only thing lacking being power at low speeds. This was greatly improved by reducing the choke tube, but the author hopes to go one better still with a modern and more efficient carburetter.

No trouble whatever has been experienced, and so, though very little money has been spent, the machine is in splendid trim. The only real expenditure was in time and trouble, but the work was all very interesting and stimulating. The total cost was about £7 10s.

As regards the machine, those readers mentioned at the beginning of this article will probably agree that for a neat, compact sporting machine it would be hard to beat this design. It affords a most delightful riding position and steers readily "hands off."

The little 3½ h.p. twin engine is an eye-opener in "revving"; there seems no doubt at all as to the efficiency of overhead valves.

In conclusion, any handy amateur can do the sort of thing described above if he really determines not to be beaten, and he will do it much better than anyone else—barring the makers—as it is his own beloved mount he is restoring to health. He will gain an enormous amount of knowledge in the process; will discover how to do difficult jobs with the simplest tools (which suffer in the process!), and will improve his vocabulary 50% because of the "cussedness" of inanimate objects, more especially bolts. But he will enjoy himself and get a really substantial reward for his trouble.

J. B. BLAXLAND.

Showing how the crack in the ball race of the steering head was repaired. That on the left shows location of crack; the upper right-hand sketch is an elevation in part section, and the lower a plan of the repair.

**PEDALS VERSUS ENGINE POWER. ITALIAN ARMY CYCLIST MACHINE GUNS.**

Italian army pedal cycles carrying machine guns in parts. One gun is spread over three machines, as illustrated. On the left is the bicycle carrying the gun barrel complete, then the machine carrying the tripod, and on the right the ammunition box and small parts. These bicycles are attached to the world famous Bersaglieri, and it is interesting to compare them with the more modern British motor machine gun outfits.

# THE HOCKLEY TWO-STROKE.

A Lightweight Specially Designed for Use in Overseas Parts.

**I**N order to produce a lightweight machine which is sufficiently strong to withstand the rough tracks encountered in some of the Overseas Dominions the Hockley Motor Co., Birmingham, are producing a 2½ h.p. two-stroke with a specially strengthened frame. This is done by an extra down tube, extending from the top of the steering head to the crank case cradle, by means of which the front of the frame is triangulated, and the steering head, which is unusually long, is amply supported.

## The Engine.

The 2½ h.p. engine, which has a bore and stroke of 70 mm. (269 c.c.), incorporates several interesting features, the most important being, perhaps, the system of lubrication. This is carried out by means of a suction drip feed, which delivers the oil to a distributing box situated just above the level of the engine on the down tube of the cycle.

The oil is led from this box by three separate pipes, one going direct to the cylinder wall, the other two to each of the main bearings. A ball valve is fitted at the entrance to the distributing box, so that if the oil should be left turned on when the engine is stationary the oil does not flood the crank case. This method, we are told, has proved both economical and efficient.

The transfer passage in this engine is not cast entirely enclosed as in most engines, but is fitted with an inspection cover, and, being made in this manner, it enables better and more accurate machining to be effected. The exhaust is led to the silencer *via* two exhaust pipes, while the compression release is also connected by a pipe to the exhaust pipe, thus obviating the objectionable hissing caused when the release is direct into the air.

The silencer is merely an expansion box from which the gas leaves *via* an extension pipe.

The Hockley 269 c.c. two-stroke engine. Note the special lubricating device on the left, which takes oil to a distributing box, from which it is conveyed to the various portions of the engine. Also note double exhaust pipes and inspection covers to the transfer passage.

## Other Details.

The magneto is placed on a bracket cast in one with the crank case, is situated high up behind the cylinder in a place where it is well protected from the influence of mud and water, and driven by an enclosed chain. A two-speed, countershaft gear with chain and belt transmission is fitted. The belt rim brake is actuated by a most substantial pedal, while the good ground clearance and substantial frame construction should render this machine very suitable for Overseas use, for which it was primarily intended. Unfortunately, owing to the scarcity of material, especially aluminium, the firm tell us they have many more orders than they will be able to cope with for a considerable time.

The 2½ h.p. Hockley lightweight two-stroke. The special design of frame is claimed to give great strength to resist the bad road conditions overseas, for which work the machine is specially intended.

## STOPPING PETROL LEAKS.

**M**ESSRS. THE COUNTY CHEMICAL CO., LTD., Bradford Street, Birmingham, have lately placed on the market a useful outfit for the purpose of stopping petrol leaks. With petrol at the present price, motor cyclists are naturally only too anxious to save every drop of the precious fuel, and a leaky tank or petrol pipe, irrespective of the inconvenience which attends it, will cause the motor cyclist deep anxiety when he thinks how rapidly the valuable fluid is escaping. The outfit contains a tin of Chemico Petrol Stop, a supply of bandage, a couple of angle plates, and a tube of shellac varnish.

### How to Effect the Repair.

The method employed to repair the leak is to cover the place copiously with the paste, after the surface to which the paste is to be applied has been thoroughly

The Chemico petrol leak repair outfit, a new introduction which is described herewith.

cleaned. The place should then be bound up as tightly as possible with the bandage, and the exterior surface thereof should then be painted with shellac varnish to prevent exterior moisture from reaching the paste, also forming a further protection for the repair itself. For the case of a repair occurring at the bottom or corner of the tank where the bandage could not be made to lie close enough to the repair to keep the paste up to its work, angle plates are supplied, and in a case of this kind the bandage is wrapped over the angle plate. It is not intended that the outfit should be other than a substitute for a proper soldered repair, but it is guaranteed to get the motor cyclist home, and a repair stopped in this way is claimed by the manufacturers to last satisfactorily for some hundreds of miles, and any reasonable length of time.

## THE COOPER SIDECAR.

A Handsome Body providing Closed Accommodation for Luggage.

**A** VERY attractive sidecar is that which is manufactured by Messrs. Cooper and Co., Belgrave Road, Birmingham. There are several excellent points about the design of the body, and apart from the appearance, which is most pleasing, probably the most attractive feature is the amount of room provided for the accommodation of luggage. It will be noticed from the illustration that the back of the body is bulbous in shape; the space within is entirely devoted to one large locker, access to which is obtained by the large door indicated by the dotted lines.

Although this bulbous back is in no way exaggerated, ample room is provided in the locker to carry comfortably a fairly large suit case or portmanteau. In this position the luggage is not only protected from the weather, but is not subjected to bumping and rattling, as when carried on the usual luggage grid. The nose of the body is constructed of metal reinforced by wood with a cane binding. In this manner the cracking and splitting of the joints so frequently noticed in coachbuilt bodies after wear is entirely overcome, while the wood reinforcement prevents denting. The upholstery is very well carried out in brown grained pegamoid, the back of the seat being sprung with the aid of coiled upholstery springs. A box spring cushion is provided, under which is situated the usual locker for spares.

### The Construction of the Chassis.

The chassis is quite a simple one, but is very strong, while the weight of the body is nicely distributed over the axle. Three-point attachment is used, and the

front connection is clamped to a special double tube framework on which it can be moved backwards or forwards for adjustment, while all tendency to twist is obviated. All three connections are quickly detachable, each requiring only one nut to be undone to remove them from their sockets. At the rear the body is suspended on Cee springs, while the front is supported on quarter elliptic. The method of attaching the springs to the chassis is noteworthy, as instead of being secured by the more usual loop

clips they are supported on special lugs brazed to the frame, to which the springs are securely clamped by substantial clips. The mudguard is also well designed, it being very wide, in addition to having a deep valance. It is supported on three strong tubular stays, from which it can readily be detached if required by undoing only three accessible nuts. A foot plate is attached to two lugs, also brazed to the frame, to facilitate mounting and dismounting from the car.

A Cooper coachbuilt sidecar, the features of which are referred to on this page.

## A DETACHABLE WHEEL AND TRANSMISSION SHOCK ABSORBER.

**A** N ingenious back hub comprising a transmission shock absorber and detachable wheel has lately been designed by Mr. David Levy, 17, Drewstead Road, Streatham Hill, S.W. At the end of the hub shell there is a disc in which four slots are cut, corresponding with four dogs on another disc, which is attached to the driving portion connected to the brake drum

by means of the spring. The wheel is removed by undoing the nut on the near side of the machine and withdrawing the spindle. On the spindle being withdrawn and the distance piece removed the whole wheel may be lifted out bodily. The hub runs on ball bearings on a hollow spindle.

### The Shock Absorber.

The transmission shock absorber consists of a coil spring, one end of which is attached to the periphery of the brake drum and the other end to the driving portion; consequently, any impulses of the engine are absorbed by the spring. In the event of the spring giving way or becoming detached dogs are provided which allow the drive to be solid. The movement of the spring is on ball bearings, as well as the sprocket wheel, which acts with the hub.

The design is particularly neat, and is well worthy of the consideration of the manufacturer who has not got a transmission shock absorber or a detachable wheel of his own. So far the device has only reached the model stage; but we are very well impressed with it, and consider it to be both well designed and ingenious.

Levy's detachable wheel and transmission shock absorber.

G. S. Oboukhoff, a prominent Moscow motor cyclist, who is now on active service with the army of our Russian Ally

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Too Strong a Mixture.

**[?]** I have a 1908 3 h.p. single-cylinder N.S.U., m.o.i.v., with low-tension Eisemann magneto and coil and Amac carburetter. It fires evenly when the throttle is slightly open, but when opened to half way it misfires. It will take full air at any speed. I have had trouble with a choked jet.—A.M.

The trouble seems to be due to the fact that you are using too large a jet, which causes the mixture to be so strong that the engine chokes. Try opening the air slides at the side of the spray chamber.

### Pre-ignition

**[?]** I have a 1913 2 h.p. single-cylinder, single gear lightweight. (1.) It loses power quickly on hills. Often on a slight up gradient, with a head wind, it pulls up altogether, but starts again immediately when pushed off. (2.) It is fitted with a No. 26 jet B and B carburetter. Is this correct? (3.) If the pulley is twisted through the belt on, a certain amount of play is felt before the piston moves.—L.E.S.

(1.) The trouble is probably due to pre-ignition, which may be caused by either a faulty plug with unsuitable electrodes or to excessive carbon deposit. The piston rings being stuck in their grooves might also cause the engine to pull up in this manner when working hard. (2.) The size of jet you mention should be about correct. If too small a jet is fitted popping in the carburetter when trying to start will take place, and if too large a jet the engine will be inclined to choke. With your particular type of carburetter—that is, one that is not of the straight through pattern—if the correct sized jet is fitted it should not be possible to start the engine unless the air be fully closed. Then when running at speeds up to about threequarter throttle opening the engine should give the best results with the air opened to about the same extent. If more air than throttle is apparently needed at full speed, then the jet is slightly too large, while if at full speed only about half air can be given then the jet is slightly too small. (3.) It is probable that the big or small ends require rebushing; this should be remedied at once.

### Refusal to Start.

**[?]** My machine is a 1915 2½ h.p. single-cylinder lightweight, fixed ignition. I have had great trouble to get the machine to start, and found that there was no spark. I then returned the magneto to the makers, but the machine still refuses to fire, explosions continually taking place in the carburetter. The engine is perfectly free from carbon, the valves properly ground in, and the compression good. I should be obliged if you would let me know the likely cause of the trouble.—W.J.

First of all make sure that all ordinary adjustments are correct, i.e., that the plug is clean, and that a spark actually takes place between the points. This can be tested by removing the plug from the cylinder and placing the metal body against the cylinder, taking care that the terminal does not touch any part of the

machine; then revolve the engine smartly by pulling the back wheel over, when a good spark should be obtained. If no spark can be obtained, try a new plug. Make quite sure the high-tension wire is in order, and that the contact points are free and separating the correct distance, viz., .4 mm. You might also check the timing: exhaust valve to close top dead centre, inlet to close bottom dead centre; spark should take place when piston is within about 3 or 4 mm. from top of compression stroke. When these adjustments have been checked, next ascertain that petrol is reaching the carburetter, and that all passages and jet are quite clear; that no air leaks exist between the carburetter and engine. Make sure that all valves are closing properly. The clearance between the valve stems and tappets should be about .4 mm. If all these adjustments are correct an easy

start should be possible. Inject a few drops of petrol through compression tap to free the piston, slightly flood carburetter, shut air lever, and give only about one-third throttle opening.

### Sluggish Running.

**[?]** I have a 6 h.p. twin Rex machine, and, though I am a fairly experienced motorist, I cannot find out what is the matter with it. Even when riding solo it is impossible to travel more than 20 m.p.h. with 4 to 1 gear. Provided there are no bad bends in the road, I can climb a hill of 1 in 8 as fast as I can come down with engine firing. I can also travel as fast under ordinary circumstances with a sidecar as solo. Apparently it is not lack of power. I have tried a lower gear, but speed was reduced. I have tried the valves with all sorts of timings. At present the exhaust valves commence to open when the pistons are ⅞ in. from the bottom of the firing stroke. The inlet valves open just over the dead centre. The magneto points break when the piston is on top, with the ignition control lever almost fully retarded; so that I can fire very early if necessary. The spark at both plugs is very good. I have been wondering if the cause is that the flywheels are not properly balanced. Will you kindly say what you consider the cause of the trouble?—H.T.

There is evidently something very wrong with your machine; but it is difficult to say what the trouble actually is without seeing it. The symptoms certainly seem to indicate incorrect timing. You should make sure the exhaust valves shut at the correct time, viz., when the pistons are on the top dead centre. If this is correct the opening of the valves will come automatically correct, owing to the design of the cam. The opening position you mention seems about correct, provided the valves shut correctly. The other timing points you mention also seem to be right. You should make sure the valve springs are in good condition, and that the exhaust and inlet passages are both quite clear, and the silencer is in no way stopped up. Is it possible that incorrect balance might cause the trouble, though it is rather improbable. Try gearing higher.

### PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

In view of the decision of the Government to limit the import of material for the manufacture of paper it is imperative that every possible step should be taken to avoid waste of paper in any form. It has been the custom in the past for newsagents to order a certain number of papers for chance sales, and these copies if unsold become what are known as "returns"; in other words, waste copies.

In the case of "THE MOTOR CYCLE" the percentage of returned unsold copies has been remarkably low, but in order to conserve the supply of paper in future it is desirable that the waste of copies, ordered to accommodate occasional purchasers, shall as far as possible be eliminated.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in this matter by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

### Machine for Business Purposes.

**?** My professional work involves me in much travelling, which, with the present restricted train services, leads to an enormous waste of time, and I am convinced that a motor cycle would prove an economy both of time and money. But what mount shall I get? I should have to do a minimum of 350 miles per week. The roads run through flat or undulating country, with only a few fairly stiff hills. I want a machine that is economical in consumption of petrol, as I must spend as little as is compatible with efficiency. Further, I should at times require a sidecar for my wife, but it would not always be necessary for my business runs. (1.) Would you advise a combination rather than a solo; and does a combination mean a much greater consumption of petrol when running empty? (2.) What horse-power would you suggest? (3.) Would a good second-hand outfit suit my purpose, or would you advise a new one? (4.) What mileage per hour should one allow on an average to a decent mount?—T.S.

(1.) If you intend doing most of your riding solo, and only taking a sidecar occasionally, we would not advise a heavy powerful bicycle such as is sold for use with a sidecar continuously. Of course, the higher the power and heavier the machine, the greater will be the petrol consumption. A single-cylinder is, of course, the least complicated, and requires the least attention; but, on the other hand, a twin, especially one of the horizontal type, is by far the more comfortable to ride and handier to manipulate, owing to the smoother running engine. There is very little difference between the general running cost of a twin and a single-cylinder of equal power, though probably the twin is lighter on tyres and transmission than a single. (2.) As you intend to use a sidecar occasionally, certainly not less than  $3\frac{1}{2}$  h.p. (3.) It would be better to purchase a good second-hand outfit rather than a cheap new one, though, of course, if you can afford it, a new outfit would

be preferable, as you then get the makers' guarantee. (4.) On give-and-take roads it takes a fast machine to average a greater speed than 20-25 m.p.h. for long distances.

### Double Pole Plugs.

**?** Would you kindly tell me if there is any great advantage in using double pole plugs in series with ordinary plugs on a 6 h.p. twin motor cycle when used for ordinary touring purposes, and not for racing or high speed, and can you advise me as to the best kind of plugs to use on such an engine (air cooled)? Is there any advantage in using single-point plugs, or are the two or three-point variety preferable? I am told the three-point plug with blade-like points is liable to cause pre-ignition. —H.C.

We do not think there is any particular object in using double-pole plugs. Use good single or multi-point plugs made by a well-known maker. A single-point plug is best if the engine is inclined to be oily, as the spark occurring at the same point each time tends to prevent oiling up. We do not advise the pattern in which the points have flattened ends.

### READERS' REPLIES.

#### Lack of Power.

As an old subscriber I am much interested in "J.R.'s" letter re his poor compression on front cylinder. I have run a 4 h.p. horizontal twin for a year, the first 2,000 miles with constant trouble in the front cylinder due to lack of lubrication. I had an oil tank fitted on to bolt under the petrol tank, and sight feed attached, with copper pipe on to the front cylinder. The result has been that I have done a big subsequent mileage with no recurrence of the trouble, and instead of my oil sump wanting refilling every 100 miles it will go nearly 400, by reason of the much cooler running. The maker of my attachment made two or three of these; the price is 24s. complete, and it is only a matter of having the cylinder tapped.—J. M. ROWELL.

In reference to "J.R.'s" trouble, "Lack of Power," in your issue of March 9th, I think he will find that the trouble is caused through the cam which operates the rod that lifts the exhaust valve becoming worn. The continual thrust of the end wears the periphery of the cam, with the result that the exhaust valve does not get sufficient lift to allow the waste gas to escape. "J.R." will, of course, need to take off the cover of the timing gear.—F. S. FANCEY.

### Hub Gear Sluggish Change.

Re query of "A.H." in *The Motor Cycle* of March 9th regarding trouble in changing gears with three-speed hub, this trouble is due to the load on the gear wheels inside the hub being too great to allow the spring actuating the gear change to slide the lower dogs into mesh, and is aggravated by presence of dirty oil. If "A.H." will *de-clutch* when changing down and close throttle slightly during the process, as in car driving, he will find his trouble disappear. The same difficulty is sometimes evident on starting from rest, even on the level, after having started the engine in the usual way with the kick starter or pedals, and while endeavouring to change down to middle or bottom before engaging clutch. In this case, slow up the engine before changing down. Hub gears give highest satisfaction with a slow-running or pilot jet carburettor on this account. Change up with a touch on exhaust lifter only, but use clutch for all changing down. Clutch failure is due to dirty condition of hub or to unsuitable or thick oil. Use sperm oil or ordinary good cycle oil, and wash hub out with paraffin frequently.—F.E.S.

### EXPERIENCES WANTED.

"J.K." (Liverpool).—Grado multi pulley for use on Triumph.

"SD 1755" (Darvel).—T.D.C. de Luxe with variable pulley and with two-speed countershaft gear.

"H.F.G." (Purley).—1915 5 h.p. Indian and sidecar. Durability, consumption, reliability, speed, and tyre wear.

### RECOMMENDED ROUTES.

BERKHAMSTED TO BIRMINGHAM.—R.H.D.

Berkhamsted, Fring, Aylesbury, Bicester, Aynho, Banbury, Gaydon, Warwick, Knowle, Solihull, Birmingham.

BROMYARD TO COLWYN BAY.—W.F.C.P.

Bromyard, Tenbury, Ludlow, Craven Arms, Shrewsbury, Chirk, Llangollen, Corwen, Cerrigy-Druidion, Llanrwst, Tal-y-Cafn, Colwyn Bay.

BRIGG TO ROMFORD.—J.G.E.

Brigg, Lincoln, Leadenham, Grantham, Stamford, Norman Cross, Alconbury Hill, Huntingdon, Godmanchester, Cambridge, Bishop's Stortford, Harlow, Epping, Theydon Bois, Abridge, Romford.

CARDIFF TO BRADFORD VIA BIRMINGHAM.—S.G.T.

Cardiff, Newport, Monmouth, Ross, Ledbury, Malvern, Worcester, Droitwich, Bromsgrove, Birmingham, Sutton Coldfield, Tamworth, Ashby-de-la-Zouch, Nottingham, Mansfield, Worksop, Doncaster, Wakefield, Bradford.

GENERAL SMUTS THE  
SECOND, OR

Euston Road, N.W.*

*Dear Sirs,—You will no doubt  
be interested to know that we have  
been using one of your 5 h.p.  
Combinations for hire and other  
business purposes.*

*Although the machine has done  
many hundreds of miles, it has run  
perfectly the whole time, and now  
pulls better than when new.*

*The ease of control may be judged  
from the fact that one of our  
apprentices often takes a passenger  
of 11 stone for journeys of 50 miles  
and over.*

*The petrol consumption averages  
80 miles to the gallon on give and  
take roads.*

*Faithfully yours,  
(Signed) W. R. L. PAGE.*

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

## MOTOR BICYCLES

### FOR SOLO & SIDECAR

Business riders, tourists, naval and military men, all testify to the satisfaction which B.S.A. Motor Bicycles are giving, and whether you require a machine for commercial or pleasure purposes you too will appreciate B.S.A. reliability and efficient service. The  $4\frac{1}{4}$  h.p. B.S.A. fitted with B.S.A. Countershaft Three-Speed Gear will take a sidecar almost anywhere and, owing to its economical yet powerful running, is far and away superior to a heavy higher powered machine.

THE 1916 LIST OF B.S.A. MOTOR BICYCLES SENT POST FREE ON REQUEST.

13, SMALL HEATH, BIRMINGHAM

THE MARK OF THE  
"PERFECT IN EVERY PART"  
MOTOR BICYCLE.

**COOLGUARD SPRINGS.****Simple Device for increasing the Cooling Surface on an Air-cooled Engine.**

**C**OO LGUARD springs are made by the Priory Accessory Co., Coventry, for assisting the cooling of an air-cooled engine, more especially for small two-strokes. They consist of oval wire springs, which can be fitted

Coolguard springs shown fitted to a two-stroke Triumph cylinder to reduce the temperature.

round the cylinder head of any air-cooled cylinder, the narrow edge fitting between the existing radiating fins. By this means the surface exposed to the air for cooling purposes is very considerably increased. This method of cooling, as was pointed out in an article on cooling in *The Motor Cycle* of January 20th, was utilised without any other assistance whatever on the early de Havilland air-cooled  $3\frac{1}{2}$  h.p. engine, on which it proved most satisfactory.

The fitting of these Coolguard springs as an additional cooling device has the advantage that, although the amount of surface exposed to the atmosphere for radiation is increased con-

siderably, the passage of air to the existing cylinder flanges is hardly affected. Being made of steel wire, nickel-plated, they can be sprung into position on the cylinder irrespective of its size without difficulty. Though there is no doubt that had they been made of copper or brass they would have been even more efficient, they certainly would not have been so handy to fit, and would also have been more liable to be damaged by rough usage.

**WALBRO SIDECAR COMBINED HOOD AND SCREEN.**

**T**HE simple sidecar windscreen made by Messrs. The Walbro Cycle and Motor Co., Liggin Road, Ely, which was first described and illustrated in *The Motor Cycle* of December 31st, 1914, has now been improved and made to combine the effects of a hood and screen in one simple device. The original screen consisted of a curved sheet of transparent material somewhat similar to the scuttle dash windcreens used on aeroplanes. The latest Walbro screen has been extended, and now not only screens the passenger,

but also has the effect of a hood, and it is claimed to be a perfect protection for the passenger against wind, rain, or snow, and, being entirely made of transparent material, gives a perfect view of the countryside. In order to facilitate conversation between the driver and passenger a speaking trumpet is inserted in the screen. The whole shield is hinged in the front and lifts up bodily when it is desired either to enter or dismount from the car. One of the chief advantages over the ordinary hood and screen is that, owing to its shape, the wind resistance is reduced to a minimum, while it is extremely light and inexpensive.

**THE SPRING FRAME IVY.**

**S**PRING frames are certainly beginning to interest the British manufacturers, and we know of several firms who will undoubtedly be making machines so equipped by the time the war is over.

One of the latest firms to manufacture a spring frame is Messrs. S. A. Newman and Co., Birmingham, the makers of the Ivy. This machine has been undergoing tests for some time, and has now been passed as quite satisfactory, but there is little hope of the firm being able to deliver this model till after the war.

The rear springing has been obtained in a more or less orthodox manner, the back chain stays being hinged on substantial steel bushed bearings behind the gear box. The ends of these stays are attached to two laminated springs by means of two hinged uprights, in a similar manner to that adopted in the Indian. The springs are attached rigidly to the bicycle frame under the seat lug. When a sidecar is attached to the machine the rear main connection consists of a tube bolted through this lug. The wheelbase has only been increased  $1\frac{1}{2}$  in. by the springing.

The latest Walbro sidecar windscreen has been considerably extended since it was first illustrated in *"The Motor Cycle,"* of Dec. 31st, 1914, so that it now takes the form of a combined hood and screen. Being made of transparent material, it in no way interferes with the passenger's view of the surrounding scenery, whilst conversation with the driver may be carried on by means of a speaking trumpet.

## ST. PATRICK'S DAY TRIALS.

THE  
DUBLIN  
CLUB'S  
TRIP TO  
GLENDA-  
LOUGH.

R. Fennell (4 h.p. Norton sidecar) on the starting line. The figure in uniform is T. E. Greene, the well-known Irish competition rider, who is now in the Mechanical Transport Section of the A.S.C., and was home on leave for a few days previous to going on service overseas. C. E. Kettle (4½ h.p. B.S.A.) leaving the checking station at Kilmacanogue.

**T**HE opening competition of the season of the Dublin and District Motor Cycle Club was held on Friday last, St. Patrick's Day being a Bank Holiday in Ireland. After a long spell of exceptionally bad weather, it was a pleasant change to find the conditions agreeable for motor cycling, although the roads were very heavy in parts.

The route was a relatively short and easy one, to Glendalough and back, and with two hours' interval at the turning point and no secret checks to worry one, the trial was not of an arduous character. Out of an entry of fourteen, twelve riders competed. The conditions of the trial required the competitors to make non-stop runs between each of the three sections into which the course was divided. The only one of these that gave trouble on the outward journey was between Kilmacanogue and Mountain Stage Tavern, this section including the ascent of the Sugarloaf from the Rocky Valley. The road was so greasy that some of the solo riders came over, while Kettle (B.S.A. sc.) had an involuntary stoppage to adjust a throttle wire. Most of the competitors were on time at Glendalough. The return journey was easier, being by the Vale of Clara, Rathnew, Newtownmountkennedy, and Bray, and of those who checked in at Glendalough the following reached the finish:

R. Arm-trong (8 Enfield sc.)	L. Carter (7-9 Excelsior sc.)
R. Fennell (4 Norton sc.)	D. Allen (2½ Sun)
J. McKenzie (5 Indian sc.)	M. Keegan (3½ Triumph)
T. Morrogh (2½ Douglas)	S. Allen (3½ James)
P. Hurse (4½ B.S.A.)	P. H. Morrogh (2½ Douglas)
S. Redmand (3½ Indian)	

## CORK TO DUNGARVAN.

The Cork and District M.C.C. took advantage of the Irish Bank Holiday on Friday last to open their competitive season. The event was a reliability trial to Dungarvan and back, and a field of twenty-four turned out for the event. The weather was mild and springlike, in striking

contrast to the Arctic weather recently experienced. Of the two dozen competitors the following eighteen completed the journey:

H. Lester (6 A.J.S. sc.)
Lt. M. Sullivan (3½ Sunbeam)
D. Lucy (2½ Douglas)
R. Perico (2½ Douglas)
J. Gibbins (2½ A.J.S.)
E. O'Sullivan (3½ Triumph sc.)
C. Neff (7-9 Harley-Davidson sc.)
C. S. Hostford (4 A.J.S. sc.)
P. J. Frost (6 Enfield sc.)
F. L. Dooley (4½ B.S.A.)
C. B. Franklin (7-9 Indian sc.)
L.-Cpl. Walsh (4 Triumph)
P. J. O'Hea (7-9 Indian)
E. MacSweeney (6 Sunbeam sc.)
E. Creagh (6 A.J.S. sc.)
J. Atkinson (3½ Ariel sc.)
J. Murphy (7 Indian sc.)
M. P. Lawton (3½ Triumph)

As most of the competitors secured full marks, the awards and placings will depend on the variation from schedule time at the various checking stations.

## Norton Extensions.

The new works of Norton Motors, Ltd., are now in process of occupation, and all correspondence intended for this firm should be addressed to Philips Street, Aston, Birmingham.

## A WAR ZONE FITTING.

Back stand clip, consisting of spring from stand to carrier, fitted to a military Douglas by Cpl. H. R. Willoughby, R.E.

# "THE MOTOR CYCLE" RECRUITING SECTION.

## Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

## Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

**R**ECRUITING for the Motor Machine Gun Service is still brisk, the applications hitherto having exceeded the vacancies. More batteries having left for active service, there is further accommodation at the training centre, and this week it was expected that another large batch of motor cyclists and car drivers would be enrolled.

On Tuesday afternoon Mr. Geoffrey Smith, editor of *The Motor Cycle*, was to test in Coventry about a hundred recruits, yesterday (Wednesday) he was due in Nottingham for the same purpose, and on Saturday afternoon next, the 25th inst., he will be in London (at *The Motor Cycle* Offices, 20, Tudor Street, London, E.C.) to accept suitable men who have made application in and around the Metropolitan area.

Suitable applicants from the London district have been notified to attend, and it may be impossible to see all the others who may present themselves.

Only experienced motor cyclists and car drivers may be accepted at present. Applicants must be of good physique, possess good eyesight, and be medically fit for service abroad.

The conditions of enlistment are:

Pay 1s. 2½d. per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limits, 19 to 40.

## Latest M.M.G.S. Recruits.

A list of recruits accepted last week is appended.

Adams, S. J., Ware.	Lowson, A., Dundee.
Adamson, G. J., Cupar, N.B.	Lyne, E. C., Hove.
Andrew, A. W., Tenbridge.	Malpass, C. T., Raynes Park.
Barracough, H., Coventry.	Manser, G., London.
Beattie, B., South.	Meade, J. V., Barking.
Benson, W., Peterborough.	Merry, J. P., Salisbury.
Bissett, G. H., Dundee.	Miller, B. G., Falkirk.
Blackmore, G. M., Southsea.	Milne, H., Rochdale.
Bradford, F. J., Wolverhampton.	Moore, F., Halifax.
Clayton, O., Great Harwood.	Naylor, G., Harwood.
Coles, J. J., Westgate-on-Sea.	Newington, W., Wadhurst.
Colquhoun, J. W., Bootle.	Nixon, H., Grimsby.
Crummie, J., Hull.	Phillips, C., Chesham.
Dawson, W. T., Boston.	Powell, R. J., London.
Dean, G. E., London.	Raven, F., Greenford.
Dyer, F., Curry Rivel.	Raynor, F., Grimsby.
Edwards, W. C., Coventry.	Reed, R. S., Evercreech.
Elliott, A., Hull.	Rivers, G., South Molton.
Evans, E. T., Maesteg.	Roberts, A. L., Leicester.
Fibbens, C., Woking.	Rosenthal, A. A., Nottingham.
Firth, F. S., Grimsby.	Ross, A., Seaforth.
Fisher, R. H., Reepham.	Sykes, E., Bournemouth.
Fuller, F. W., Carshalton.	Taylor, P. A., Ebbw Vale.
Gloyn, C. F., Plymouth.	Thompson, A., Northwich.
Graham, W. F., Tamworth.	Thornhill, H., Derby.
Grewcock, G., Barwell.	Tomkins, A. T., Coventry.
Griffiths, F. J., Birkenhead.	Trickett, D., Coventry.
Hawgood, A. A., Derby.	Utting, R. A., King's Lynn.
Haywood, D. H., Bengeworth.	Weatherall, F. W., London.
Hibbens, C., Huntingdon.	Weatherill, W. G., Blackhill.
Hood, B. J., Bath.	Webby, J., Yeovil.
Husbands, A., Tonypandy.	Williams, A. E., Manchester.
Jacobs, H. W., Bristol.	Williams, T., Bootle.
Johnson, C., Warr.	Williams, T. J., Ebbw Vale.
Jones, A. W., Bargoed.	Winter, D., A.
King, W. R., Wishaw, N.B.	Witter, H., Southport.
Kirby, F. A., Norwich.	Witty, J. A., Leeds.
Kitson, J., Bradford.	Woods, R. D., Derby.
Lawn, H., Thirsk.	Woolmer, G. G., Royston.
Lawson, A., Darvel.	Yallop, R. R., Norwich.
Lee, L., Stockingford.	Yates, H. I., Blackpool.
Leeming, C. H., Walsall.	Zimmerman, H., Hull.

Among the above were a number of men originally passed for the R.E. signal service, besides a number of married men who had not previously attested.

On this page an application form appears which should be used in preference to old ones. Readers should fill in each item carefully, but replies cannot be issued for a day or two owing to the mass of correspondence—much of it quite unnecessary if only the notes and instructions on this page were attended to. The vacancies are for immediate service only.

The next inspection of recruits in the Midlands is on Tuesday next, the 28th inst., at the Recruiting Office, Masonic Buildings, Coventry.

A number of applications have been received from Scotland, Ireland, and Guernsey. Motor cyclists living at a long distance from Coventry would do well when applying to enclose two testimonials as to their driving ability, if they wish railway warrants to be sent to them without delay and further correspondence.

The Editor regrets that several applications from motor cyclists were received too late to permit an interview before the writers were due to report themselves under the Group system.

Three months' riding experience is not considered sufficient experience for the M.M.G.S. One applicant who stated that he had had nine years' experience did not know the make of carburetter on his machine, nor could he give any reasons for falling off in power in an engine. Another with "three years' experience" talked of his Rex machine being fitted with a twin-cylinder two-stroke J.A.P. engine!

A goodly number of applications for transfers from other units have been received, but these must stand over for the present. It may save needless correspondence if it is mentioned that transfers from Territorial regiments are impossible.

## APPLICATION TO JOIN THE MOTOR MACHINE GUN SERVICE.

Name .....

Address .....

Chest measurement ..... Height .....

Group No. ....

or Age .....

Class No. ....

How long have you been a motor cyclist? .....

Can you execute running repairs? .....

Are you fit for overseas service? .....

Occupation .....

When are you called up? .....

WHAT DATE COULD YOU JOIN? .....

After filling in the above particulars return to:

MR. GEOFFREY SMITH,  
Inspecting Officer,  
19, Hertford Street,  
COVENTRY.

[Issue March 23rd, 1916.]

## TIME TO LIGHT LAMPS

GREENWICH TIME.

March 23rd	...	6.46 p.m.
" 25th	...	6.49 "
" 27th	...	6.52 "
" 29th	...	6.55 "

### The Soldier's Razor.

Owing to difficulty in obtaining Army razors, an Army Order issued last week states that all men joining from March 20th onwards will be given an allowance of 2s. in lieu of the issue in kind of a razor.

### Bromley Trap—War Office Victim.

Amongst victims of the Bromley, Kent, trap (still being worked up to 8 p.m.) was a staff officer at Whitehall and a Catford lady motor cyclist, Mrs. Leng. The latter informed the constable that this was the first time she had been stopped after 10,000 miles. Fined 40s.

### A Sidecar Race in Victoria.

The Victorian M.C.C. held a sidecar race, in which there were seven starters. Results on handicap were:

1. H. McCall (6 h.p. J.A.P.). Time 1m. 16½s.; handicap 20s.
2. S. Nunan (7 h.p. American Excel-sior). Time 1m. 9½s.; handicap 8s.
3. P. Priestley (7 h.p. Ideal J.A.P.). Time 1m. 2½s.; scratch.

### Another War Zone Newspaper.

*On Service* is the latest journal published behind the firing line in France, and judging by the first number, a copy of which we have received, it strikes a higher note than similar publications. Lt. S. A. Rowlandson is the editor, and it appeals mainly to men in the Mechanical Transport at G.H.Q. The following extracts are very amusing:

Did the old soldier expect us to believe him when he said his worst experience was when he was end man on the British front of 300 miles, and the order came "Left form," and having to mark time for three weeks?

#### From "Answers to Correspondents":

CRL. F.—Many thanks for your article on "A Transport of Delight." Our paper, being so clean, we cannot print it—besides we could not possibly allow nineteen split infinitives in 450 words.

FANCIER.—You are quite wrong. G.H.Q. is not a dog's home.

Interest is added to the foregoing, when it is remembered that the replies are published in the first number.

We wish *On Service* every success, also the gallant fellows on whose behalf it is compiled.

## SPECIAL FEATURE

OVERSEAS TRADE.

::

AMATEUR REPAIRING.

THE CYCLE CAR OF THE FUTURE.

### Well-known Motor Cyclist Interned.

Many of our readers will remember Basil Vickers-Jones, the rider of a Premier twin, who put up such notable performances in Tourist Trophy Races of the past. Vickers-Jones was considered one of the finest cornerists of the day when the short triangular course in the Isle of Man was used. After retiring from Tourist Trophy and other events he took up an important position with the Premier works in Bavaria, and was interned on the outbreak of war. We had the pleasure of receiving a communication from Mr. Vickers-Jones last week, who wrote on behalf of several other engineers boxed up in an internment colony in Raabs on the Thaya, Lower Austria, expressing their displeasure in getting very behindhand in the matter, which used to be their profession. He begs us to forward a bundle of copies of *The Motor Cycle* and *The Autocar* to enable them to keep themselves up to date. On the day Mr. Vickers-Jones wrote he mentions that they had been speaking of setting on foot an "engineers' reunion," so as to keep their minds a little fresh. He goes on:

"We are altogether about sixty English in Raabs. There are also many others in the neighbouring villages. We have a full-blown 'university.' Besides being able to learn many languages, we also have very interesting lectures, etc. Mr. Campbell-Taylor, of the Daimler Co., is at present giving a course on 'Motor Car Design and Construction.'"

### The Active Service Press.

The advent of *On Service* shows that the popularity of the newspapers published, and in many cases printed also, just behind the firing line in France, is on the increase. Offhand we can recall the following published by the British:

*The Strafer.**The Listening Post.**On Service.**Our Mag.*

### Hind Cars.

We have forecars and sidecars in this country, and the Americans have lately gone a further step by introducing a "hind car." It is a sort of trailer permanently connected to the rear of the bicycle. Several such vehicles were tried in England many years ago. We recollect trying one made by Mr. G. Hilton, of Rugby, in 1904. The bicycle was a 2½ h.p. chain-driven Humber with a sloping engine.

### Bad Roads in the War Zone.

One result of recent snow and rain has been to make the roads in the war zone on the Western front (which are none too good at any time) in a shocking condition, and despatch riders have been having a far from cheerful time of late on this account. Cpl. Howard Lane, a former prominent member of the Sutton Coldfield M.C.C., tells us that the results now being obtained under such trying conditions from motor cycles are wonderful.

G. S. Oboukhoff in uniform, and mounted on a Williamson sidecar outfit. He is a pioneer motor cyclist of Russia, and holds several records. Mr. Oboukhoff has the Singer and Williamson agency for the Moscow district, and after the war intends visiting England on business.

**Our Spring Number.**

A ladies' feature will be included among the special articles in preparation for *The Motor Cycle* spring number on April 13th next.

**Army Motor Cyclists.**

A record number of recruits were expected for the Motor Machine Gun Service this week.

**Brisk Overseas Demand.**

The demand for British-made motor cycles from abroad is far greater than our manufacturers can cope with under the present war conditions.

**British Exports.**

Manufacturers relate in this issue the difficulties with which they have to contend in exporting motor cycles Overseas. The Board of Trade have the matter in hand, and an improvement in the existing conditions is confidently expected as a result of the experiences detailed.

**The National War Funds.**

At the week-end the principal relief funds stood as follow:

The Prince of Wales's National Relief Fund (£3,073,000 distributed) .. .. .	£5,827,874	0	0
Tobacco Fund .. .. .	102,134	0	0
Fund for the Sick and Wounded .. .. .	3,514,280	0	0
The Queen's Work for Women Fund .. .. .	168,713	6	10
Polish Victims' Relief Fund .. .. .	121,708	0	0

**Through a Foot and a Half of Snow.**

During the recent snow a draft of despatch riders, fifty in number, left for Devonport, a distance of 250 miles, in the charge of two artificers. After sixty miles had been covered one of the machines seized, and the artificers had to remain with it. The rest continued their journey, but being informed ten miles further on that the road was impassable for a distance of eight miles owing to snow 18in. deep, they took another route. Later the artificers, having repaired the machine, and not being warned of the snow, made their way through it, but with difficulty. One of these men is a well-known track rider. Their experiences should make interesting reading.

**The Position of the Private Owner.**

The official crusade against motoring and motorists continues, while cinema shows and many other means of sending money out of the country are let alone. "Don't use your car or motor cycle for pleasure during war time," says the latest official poster, but the amount of evidence that we have collected which shows what motorists are doing and how little purely joy-riding is indulged in is stupendous, and we can only hope that when this is summarised and placed by the R.A.C. and A.C.U. before the Government departments concerned the attitude of the latter will undergo a very decided change. Again we urge our readers to do all they can to help their country, and to enjoy the use of their machines for *recreative purposes* as little as possible, but that they should lay by their machines altogether would, we think, be unwise and unprofitable. The position of the motorist has undergone no change up to the time of writing, and we do not anticipate any official announcement until the Budget appears in the first week of next month.

**Motor Cyclist Airman Missing.**

We regret to learn that Sec.-Lt. M. A. J. Orde, R.F.C., son of Mr. J. W. Orde, secretary of the R.A.C., is missing.

**The Impressive Sight of Motors.**

According to the special correspondent of *The Times* the Portuguese Minister in Berlin, Senhor Sidonio Paes, remarked upon his arrival in Paris that it was a pleasant change after Berlin. "Motor cars circulate freely, and the whole spirit of the nation is very different from what I had been led to expect."

**Resignation of Sir William Goff.**

We are informed that Sir William Goff, Bart., D.L., J.P., one of the original directors of the Dunlop Rubber Co., has resigned his seat on the board. Sir William has been Chairman of the Irish Automobile Club, and an active pioneer of motoring in Ireland.

**N.S.W. Motor Cyclist Recruits.**

Fred S. Roberts, who came from Sydney, N.S.W., last summer to enlist in the M.M.G.S., is now a sergeant in the 25th Battery. Du Bois being a friend of Roberts, the last-named was naturally particularly interested in the experiences of du Bois on the *Möwe*, recorded in the last issue of this journal.

**IMPORTS OF CARS AND MOTOR CYCLES TO BE PROHIBITED.**

It will come as no surprise to those readers who have closely watched the course of events to learn that the British Government has decided to place a ban upon the importation of motor cars for private uses. The term "Motor Cars," of course, includes motor cycles within the meaning of Government Acts. Cars and motor cycles are not the only articles affected by this new order, and it is understood that the ruling will apply equally to all countries, including the British Dominions and Colonies.

**A Sad Accident.**

The fatal accident to the Rev. Thomas Francis Stewart, a member of the Hartlebury College of Clergy, and formerly vicar of St. Paul's, Worcester, whilst motor cycling in Worcestershire, is very sad. He was a well-known man locally, and had only recently returned from a year's service as naval chaplain.

**A Proposed New Speed Limit.**

A ten miles per hour speed limit order has been applied for in respect of roads at Smethwick and West Bromwich. Motor cyclists able to assist the Automobile Association in opposing the order are invited to communicate their views to the secretary at Fanum House, Whitcomb Street, W.C.

**The New Taxes.**

All sorts of forecasts are being indulged in as to the attentions of the Chancellor of the Exchequer toward motorists in his new Budget. It has been stated that the existing taxes will be doubled. Whilst it is hoped that the new taxes may not prove so severe, car owners as well as motor cyclists must be prepared for an increase to help to pay for this costly war.

## Motor Machine Gun Batteries.

OUR photographs are of two new batteries of the Motor Machine Gun Service, ready for active operation in the great war against the common enemy. The upper photograph shows the 22nd Motor Machine Gun Battery, the lower, picture the 4th Light Armoured Motor Battery, whose equipment consists of armoured cars with motor cycle mounted infantry supports. The M.M.G.S., which is now a branch of the Machine Gun Corps sanctioned last year by His Majesty the King, has lately been extended, and embraces all kinds of mobile machine guns.

## 22nd MOTOR MACHINE GUN BATTERY.

Motor bicyclists, sidecarists, and car drivers form the *personnel* of this comparatively new arm of the Service.

The formation of the sidecar batteries is eighteen Vickers-Clyno sidecars (in three sections), a sidecar outfit for the commanding officer, Triumph motor bicycles for the use of the section commanders and an orderly, and five transport cars.

Vehicles of the Light Armoured Motor Batteries, the newest and most up-to-date motor section of our gallant Army, consist of motor bicycles, armoured cars, transport vehicles, and repair lorries.

The excellent stamp of men forming the M.M.G.S., drawn from the ranks of young and sporting motor cyclists and car drivers, has many times evoked the praise of the commanding officer, Lt.-Col. R. W. Bradley, D.S.O., and already a number of men have gained special awards for conspicuous gallantry in the field.

It will be recalled that Viscount French, the Commander-in-Chief of the Home Forces, recently paid a visit of inspection to the training centre of the M.M.G.S., and at the same time decorated two men for distinguished services.

## 4th LIGHT ARMOURED MOTOR BATTERY.

Cycle."*

## ANOTHER MOTOR CYCLIST AIRMAN KILLED.

**W**E learn with extreme regret that Graham Price, the well-known private owner competitor rider of Bat motor cycles, who was attached to the Royal Flying Corps, has met his death during a fight in the air with an enemy aeroplane. Like so many brave motor cyclists, he became an expert pilot, and, like so many others, alas! he has gone to swell the ever-increasing motor cyclists' roll of honour.

Graham Price was a keen competition rider, and his name often figured in the principal events in 1914. In the last London to Edinburgh run he gained a gold medal for the double journey on a 5 h.p. Bat and sidecar. Riding a similar mount solo in the Scottish Six Days he experienced bad luck, and retired on the second day; but in the English Six Days, when he again rode a solo machine, he earned a gold medal.

In the early days of the war Price joined the R.E.'s, as a despatch rider, and was in the famous retreat from Mons. It was only at the early part of this year that he obtained his commission in the R.F.C., and it was only a short time ago that we heard of this aviator attacking at the same time three Fokker and two other enemy aeroplanes. His parents have received a personal telegram from the King condoling with them in their loss.

An officer in the Dublin Fusiliers who served for twelve months in France as a despatch rider with poor Price pays a high tribute to his qualities as a soldier. This writer considered him to be by far the most efficient despatch rider he had ever come across, and the best friend and comrade one could wish for. He had a peculiar genius as a motor cyclist.

Another example of his fine character was shown by a letter he recently sent to his mother, in which he said: "If I am killed do not grieve for me, but feel proud that you had a son to give in the country's cause."

It is sad to think that when the next important motor cycle trial is held many familiar faces will be missing.

## CORK CLUB'S TRIAL.

**A**T the moment of going to press we have received results of the Cork and District M.C.C. Irish Bank Holiday trial, a brief report of which appears on page 278 of this issue, the figures in brackets denoting the number of marks lost:

**FIRST CLASS AWARDS.**—D. Lucy (0), F. L. Dooly (1), Lt. M. Sullivan (2), C. S. Hosford (2), A. Lester (3), P. J. O'Hea (3), E. Creagh (3), J. Gibbins (4), C. B. Franklin (4), P. J. Frost (5), E. MacSweeney (5).

**SECOND CLASS AWARD.**—C. Neff (9).

**THIRD CLASS AWARDS.**—R. Perico, L.-Cpl. Walsh, J. Atkinson, J. Murphy.  
**NEW HUDSON CHALLENGE CUP.**—D. Lucy.

**NOVICE PRIZE.**—E. Creagh.

**TEAM PRIZE.**—D. Lucy, J. Gibbins, and R. Perico.

The late Flight Lieut. Graham Price, as he appeared in his last motor cycle trial—the A.C.U. Six Days of July, 1914, and as a despatch rider. He was later granted a commission in the Royal Flying Corps.

The 2½ h.p. single-cylinder four-stroke Shaw motor attachment

## AN HISTORIC COPY OF "THE MOTOR CYCLE."

**W**E have received from Sgt. James H. Lauder, of the 1/3rd Lowland Field Ambulance, a copy of the last Buyers' Guide issue of *The Motor Cycle* that has quite a history attached to it. Sgt. Lauder tells us that the particular copy of the paper reached him while on duty not far from the front line two or three days before the evacuation of Cape Helles. On the last night—which will never be forgotten by those who passed through it—it was brought away with the last personal belongings.

The experience of our publishing department is that the Buyers' Guide number is the issue of the whole year for which there is the greatest demand, both at the date of publication and afterwards. But, however insistent and tempting the demand for copies of the issue of November 25th, 1915, may be, we shall retain such a famous copy as the one sent us by Sgt. Lauder.

Our correspondent was at the time of writing in Egypt, and he is very enthusiastic concerning motor cycling around Cairo, where there are some good roads.

## THE SHAW MOTOR ATTACHMENT.

**M**OTOR attachments for pedal cycles have always been attractive to a section of the community, and many and varied have been the different types devised for meeting the demand. One of the latest is known as the Shaw; it hails from America, and the agency in England has been taken up by Messrs. Bramco, Ltd., of Ellys Road, Coventry.

This outfit consists of a 2½ h.p. four-stroke single-cylinder engine which clamps to the down tube of an ordinary pedal cycle. A belt rim is supplied which has to be attached to the rear wheel of the cycle, the power then being transmitted by means of a round leather belt over a jockey pulley, by means of which the belt tension may be slackened, so allowing it to slip, enabling a free engine effect to be obtained. Shaw outfits can be obtained with either magneto or battery ignition.

The speed is controlled by the twist grip method, so popular in America. A small cylindrical tank over the engine contains the petrol and oil, there being sufficient for a journey of about seventy-five miles, the lubricant being supplied to the engine *via* a drip feed. It is claimed that speeds ranging between 4 and 35 m.p.h. can be obtained, but we should think that an ordinary cycle ridden at 35 m.p.h. without spring forks would not be particularly pleasant.

I HAVE a sturdy belief in the ultimate future of cycle cars and still drink to "der Tag," even though I was not amongst those who fancied that their day had come two or three years ago, when violent and premature attempts were made to persuade the trade and public that the lighter branches of motor engineering were already in a position to establish a new industry. I have faint, but sincere, hopes that the oft-promised and long-delayed economical four-wheeler on motor cycling lines is near at hand. The war has made our designers and factories less groovy and stereotyped in their outlook. It has distributed those ideals of lightness which are an essential feature of aviation work. Above all, the debts which war will leave have impoverished the nation for at least a generation and will bequeath a compulsion towards economy which the trade will be forced to respect. Therefore many of our less conventional engineers are thinking cycle cars, and a fresh boom—possibly premature, possibly sensible—is quite likely to succeed the arrival of peace.

This being so, there are one or two factors, easily overlooked on the drawing desk, which I should like to emphasise.

#### What Designers must Avoid.

Previous cycle cars have been great sinners in respect of vibration. To this general statement there are hardly any exceptions. The man of moderate means will put up with a good deal of vibration, Motor bicycles vibrate—especially if the frame be rigid, the speed high, and the road a war-broken British highway of to-day. But the average premature cycle car vibrated more than any motor bicycle, partly because its chassis was imperfectly sprung, partly because its engine belonged to one, or other of those classes which are grossly unbalanced, especially when running free. The car—light or heavy—has created a very high standard for four-wheelers in this matter; and a cycle car which aspires to lead a boom must be genuinely free from unreasonable vibrations, whether arising from road or engine. The problem is easier than it looks. Light chassis can be properly sprung, e.g., the Baby Peugeot. Small air-cooled engines can be decently balanced, e.g., the Douglas and the big Williamson.

Secondly, cycle cars of the past were mostly rather hot and smelly. Their air-cooled engines were usually mounted in front, and being air-cooled reached a high temperature. Being left uncovered for cooling purposes, they were seldom clean. A traction-engine sort of smell assaulted the occupants' nostrils almost permanently. Both motor bicycles and motor cars create somewhat similar odours, but not to the same extent, and in these two cases the odour is trailed behind, and the users escape it.

Thirdly, the passengers of past cycle cars cannot "see over the hedge," a fault with which the sidecar passenger can sympathise. Admittedly, some of the finest scenery in the British Isles is hedgeless. The sides of mountain roads are usually unfenced, and it does not then matter whether the passenger's eye-level is 3ft. or 6ft. above road level. But in all the tamer and most frequented counties the hedges are high enough to shut off all the surrounding landscape from a person seated in the average sidecar or cycle car, and nothing is duller than being driven interminably between two walls of green. This problem is difficult of solution, as light weight demands a low centre of gravity if the vehicle is to be safe. Some people will say that the vogue of the sidecar proves that low seating does not matter. I am of rather a different opinion. The sidecar scores because it is detachable and cheap. The cycle car will always have to reckon with the competition of the light car, and will be weighed in the balance with it. If cycle car occupants are seated unduly low, potential purchasers will always be meditating "For another £50 I could get a light car," or "I wonder if I couldn't pick up a decent second-hand light car for the same money," and in the early days of the cycle car boom, when it really comes, the movement will need all available support.

I believe that all the three points raised in this article are vital to a successful resuscitation of the—shall we say "defunct" or "hybernating" or "moribund" cycle car movement.

ANOTHER RECORD—PILLION RIDING AT 92!  
A Warren, Ohio, U.S.A., lady, who, at the age of 92, enjoys trips mounted on the carrier of a motor cycle.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Unfit for Service.

Sir,—I was very pleased to read your leader in *The Motor Cycle* of the 2nd inst., as it is time something was found for those who are slightly unfit.

Take my case. I am 24 years of age, with over six years' experience as a cycle mechanic, can ride a motor cycle, and have some small knowledge of repairing, and have been rejected on account of defective eyesight. Knowing that my eyesight was not of the best, I tried for the R.A.M.C. in November last, and was rejected, and as far as things go at present I am apparently of no use. However, I think I could be of some use in some things, such as the A.O.C. or the R.N.A.S. workshops.

R.M.P.

#### Aluminium Pistons for Two-strokes.

Sir,—I would like to add a little evidence to your very interesting article on the subject of the use of aluminium for pistons for two strokes.

I have conducted many experiments with the use of aluminium on other parts as well; but I had one case of an engine running on a semi-Diesel forced induction system in which it was practically impossible to use a top ring on the piston at all unless the latter was constructed of aluminium and ribbed inside for cooling. The engine was a four-stroke model, but it is a very excellent proof that aluminium pistons for two strokes are of value particularly where the surface is rather large in relation to the volume, on machines of large capacity.

It is possible to alloy aluminium with many other metals, and to increase hardness without materially affecting its conductivity, but the greatest care is necessary to ensure that the exact composition of the "aluminium" is known when purchased, and there are many precautions which are essential after casting and during the process of pouring into whatever special mould is chosen.

A. M. Low, A.C.G.I., D.Sc., etc.

#### Derby Groups and the M.T., A.S.C.

Sir,—I am writing to ask you if you are aware if there is any truth in the rumour, which has gained considerable currency, that men of the Derby groups, attested and signed on for the M.T., A.S.C., will only receive the minimum rate of pay, instead of 6s. per day, as hitherto. If such is the case, it appears that married men like myself, willing to do their share, will have to suffer in more ways than one, besides being called to the Colours prematurely, though at the same time they may be fully qualified for the full rate of pay which numbers of single men already enjoy.

I may state I have been a regular reader of your valuable paper for the past eight years, and devour its interesting columns from beginning to end.

GROUP 40.

[The fact of men specifying any particular section at the time they were attested does not necessarily mean that they are drafted to that section on being called up. It is only in case there are vacancies that this can be done. It was announced some weeks ago in Parliament that the 6s. per day rate would not be paid in future to Army Service Corps men. The present rate of pay is 1s. 2d. per day for learners, this amount being doubled on the driver becoming proficient. The new decision has been announced in the pages of *The Motor Cycle*—see issue for January 6th.—Ed.]

#### Paraffin as a Fuel.

Sir,—After reading H. S. Wallis's letter in your valuable paper of March 2nd, I set about making my machine suitable for the use of paraffin. In the meantime *The Motor Cycle* of March 9th came to hand, and I read this passage from the letter of T. H. Ward: "To use paraffin in an ordinary high-class motor engine is sheer abuse. After a few months running every part of the engine will be badly worn." Mr. Wallis says a B.S.A. ran 1,000 miles on paraffin. He then took it down, and found it to be in splendid order. Now, sir, as a working man who feels the pinch of petrol at 2s. 6d. per gallon, and being afraid of spoiling my engine, I hope someone who knows what paraffin is will tell us in as simple language as possible why paraffin is bad for engines.

A POOR MAN.

Sir,—Seeing T. H. Ward's letter in your correspondence columns has led me to give my experiences with paraffin.

My machine is a 2½ horizontally-opposed engine, which has been running perfectly for nearly a year. Faced by the increased price of petrol, I bethought me of paraffin, which I first tried, without any alteration to the carburettor, in the proportion of 1 to 1 (½ gal. strained paraffin to ½ gal. No. 2 petrol). My first attempts to start the engine were fruitless. I injected petrol, placed hot rags round the carburettor, etc., and finally, after half an hour's pushing and running, I became overjoyed by a feeble popping which told me that the engine was actually firing at last. The acceleration, or what should have been acceleration, produced a knocking like a smithy; hills which I could before climb on top brought me down to low gear. I then got rid of this mixture and filled up with two parts petrol to one part paraffin. This mixture gave but slight advantage over the last, and it was only finally on a mixture of 4 to 1 that I could gain anything like the usual power and flexibility which I had before.

On overhauling the engine after about 500 miles running on these mixtures, I found that there was more deposit than after 2,000 miles on pure petrol, and when at last I got rid of the last of these mixtures and got back to petrol there was some pleasure in riding and in being able once again to start from cold in five yards.

F.R.G.S.

#### Suitable Mount for One-legged Rider.

Sir,—Some correspondence has recently appeared in *The Motor Cycle* concerning suitable mounts for men who have lost the use of limbs. My left leg is practically useless. At one time I drove a small Rover car, which was easily adaptable for the right leg. Later I looked round for a motor cycle which I could manage, and at last concluded that by having the brake pedal of an "A.J.S." altered for right foot operation (a simple alteration which the makers carried out free of charge) it would be possible for me to ride it. I took delivery of this machine in July last, and can honestly say that it has given me every satisfaction. To anyone situated like myself I can confidently recommend it as a reliable and easy machine to manage. During the whole of the past cold spell I have been able to start it up without even priming the cylinders. By the way, ease of starting is facilitated if the starting pedal is covered with two layers, one over the other, of the ordinary rubber and canvas tubing used for water connection on cars. It provides a surface which can be "felt" by the foot. I found that my boot slipped from the polished pedal fitted, also that the stop at its end cut the soles of my boot.

### Diesel Engines for Motor Cycles.

Sir,—In reply to the suggestion of "Cheap Fuel," in your issue of March 9th, I think, for the following reasons, Diesel engines could not be used on motor cycles and cars.

First of all, this class of engine is seldom made under 50 h.p., and, of course, this necessitates it being started by compressed air, or an auxiliary machine. The cycle of operations of a four-stroke Diesel engine is as follows: On the downward stroke of the piston air is drawn into the cylinder and compressed on the upward stroke to a pressure of between 450 to 500 lb. per sq. in. Just before the piston reaches the top of its stroke oil fuel is injected into the combustion chamber by means of compressed air at a pressure of about 900 lb. per sq. in. Owing to this high pressure and the design of the pulveriser through which the fuel enters the cylinder, the fuel is completely atomised, and combustion takes place owing to the very high temperature of the compressed air already in the combustion chamber, this probably being 1,500° to 2,000° F. Work is then done on the piston on its downward stroke, and the final stroke expels all the exhaust gases through the exhaust valve arranged in the cylinder cover. Owing to the heaviness of the fuel the above high pressures and temperatures are essential. From the above I think it will be obvious why an engine of the Diesel type could not be used for the propulsion of a motor car or cycle.

W. E. G. MARSHALL (R.N. Artificer).

Sir,—In your issue of March 9th I notice one of your correspondents ("Cheap Fuel") raises a query as to the possibility of using a Diesel engine for a motor cycle. May I point out the impossibility of this? To begin with, the first prohibitive factor is weight per h.p. developed, the Diesel engine being heavier than a gas engine. Secondly, vibration. I do not think it would be possible to build a frame strong enough to stand this, even supposing it were possible to build a Diesel small enough for cycle or car purposes. Thirdly, we have the question of controllability, constant speed being almost necessary in order to obtain the high efficiency of this engine, and at slow speeds the power curve falls so rapidly, and as it is undesirable to govern a motor cycle engine automatically, the human element would enter into this item too much. Fourthly, we have the high temperatures reached in the Diesel cycle, and a large volume of water per h.p. developed is necessary to overcome this in comparison with the modern highly efficient petrol engine. There are many other factors which prohibit this type of engine for car or cycle purposes, but the above are sufficient.

"Cheap Fuel" mentions the fact that there would be no electrical ignition. It is this very fact which puts so high a weight factor on the Diesel engine per h.p., due, of course, to the necessary high compression ratio, and after all the present magnetos are so efficient that one is almost apt to forget their existence on the machine.

The nearest approach to the Diesel principle for car or cycle purposes is the very interesting engine invented by Dr. Low, and which I hope to hear more of in the future, but he uses petrol, I believe. I should very much like to know if Dr. Low has experimented with diluted fuels.

M. VACY-ASH, Capt., M.T., A.S.C.

Sir,—I read with interest the letters of your correspondents on the subject of Diesel engines.

The efficiency of the ordinary motor cycle or car engine is very low, as by far the greater part of the fuel is wasted in producing heat. The following engine would eliminate much of this waste. Have a cylinder without any cooling devices and lagged with asbestos. This would keep in all the heat except that lost by the exhaust. Pre-ignition would be prevented by letting in air only through the inlet valve and by injecting petrol into the combustion chamber just as the piston begins to descend. This engine would not carbonise, as any deposit would be burnt up by the pure air on the compression stroke. To prevent damage to the valves, etc., by excessive heat, water could be injected at the same time as the fuel through a separate jet. The temperature could thus be varied between, say, 200° C. and red heat. The production of steam would convert into work the heat usually lost by cooling devices, and representing about 80% of the energy of the fuel burnt. Of

course, it would be run with sparking plugs. This petrol-steam engine would be highly economical, and produce great power. The compression ratio need not be abnormal, and I should like to know why such an engine should run at constant speed. I hold that, as the air taken in and the petrol injected can be regulated, this engine should prove as flexible as any other, possibly more so, as it is partly a steam engine.

There is nothing original in the above ideas, but I should like to see them criticised by your readers.

I would be obliged if Dr. Low would divulge the nature of the "dangerous deposit" found in engines run on paraffin.

A. B. K. WATKINS.

### Carbonisation.

Sir,—I have considerable respect for your correspondent "Ixion." Week by week he is generally interesting, well-informed, and good reading. From my own experience, however, and that of various friends, I think he is quite wrong in his frequently repeated grumbles as to the necessity for decarbonising every 1,000 or 2,000 miles with a decent engine.

In your issue of the 16th inst., for instance, he says again: "Even if it were true, as some of your correspondents allege, that any sensible rider can get 4,000 or 6,000 miles out of a decent engine between decarbonisations."

From my own experience I have never found it necessary to decarbonise except at about 4,000 miles interval with any of the following engines, i.e., 3½ h.p. Ariel, 7 h.p. Indian, four-cylinder Henderson, 2½ h.p. Douglas, and the following twin J.A.P.'s, i.e., 85 × 85, 76 × 85, 70 × 64½, and 90 × 77½ (the 76 × 85 and 90 × 77½ J.A.P.'s were special high compression engines), except, perhaps, where a great deal of riding had been done over very dusty roads.

"Ixion" attributes the rapid carbonising of his engines partly to what he calls his road burning proclivities, but I daresay my average speed on a long journey would work out about the same as his.

I know that my experiences in the above matter are in no way abnormal, and all that is necessary is always to secure good carburation and use nothing but the best and most suitable oil obtainable for one's particular engine. I have used a great deal of oil costing 7s. and 7s. 6d. per gallon, but consider this an economy, in view of the better wearing of the engine in general, and more particularly the piston rings.

If "Ixion" cares to comment on the above, let him please note that I am not insensible to the bad running of an internally dirty engine, and that I take an engine down as soon as it develops the well-known symptoms (not necessarily knocking).

My late riding has chiefly been on twin engines, but when talking of decent engines twins are, of course, included, and, as a matter of fact, first-class singles are very little behind them from the carbonisation point of view.

V. OLSSON.

### MEMBERS OF THE LEGION OF FRONTIERSMEN WHO ARE NOW IN THE ARMY.

The driver and owner of the Matchless outfit is 2nd Air-mechanic G. W. Eves, R.F.C. He speaks very highly of his Matchless, on which he has covered many miles on despatch work, including a rapid run from London to Edinburgh with three up as shown.

### Valve Tappets.

Sir,—I think some improvement might be made in the silence and wearing qualities of the tappets of a motor cycle engine. With the usual broad-faced tappet bearing against the narrow end of the valve stem a hollow is gradually worn in the tappet. If the tappet is not in line with the valve stem and is free to revolve unequal wear takes place, and thus the clearance varies; there is also a tendency for the end of the valve stem to widen out. Would it not be an improvement to have a larger bearing surface on the end of the valve stem as suggested in sketch, and why not make use of fibre to gain silence, as on some car engines?

J. B. BURNETT, JUNR.

### A Two-stroke Engine after 1,000 Miles.

Sir,—I beg to put before you my own experience of a 24 h.p. lightweight two-stroke Velocette engine. My log book shows that the machine has now covered more than 1,700 miles.

Though it was high time to take the cylinder down after the first 600 miles, I was not a little surprised to find, after what I had heard about two-stroke engine carbonising, that the top of the piston and the two piston rings were absolutely free of carbon deposit, and not the slightest trace could be found on them. Since then I have had to take the engine down three times for removing carbon deposits which accumulated, and without the slightest doubt at a far quicker rate than before.

As a designer of high-powered air-cooled engines, I am very interested in the discussions regarding this subject, and though I shall refrain from sending to your valuable paper a hasty conclusion, I am convinced from my own experience that the wear of the engine has much to do with carbonisation.

The writer of your article seems to come to the same conclusion, since he says that in most instances cleaning is required every 300 or 400 miles; but he seems to have experienced no trouble practically for the first 1,000 miles, when he writes: "Do not put off the day of cleaning too long, if the rings are to be preserved!" After the first stripping of the engine, when I found there was no deposit whatever, the piston rings being free in their grooves, I refitted the cylinder as before, but when I took the engine down the second time after 1,200 miles I found the rings absolutely stuck in and resisting all endeavours to get them free. The result was that I have to break them and fit new ones, which, by the way, made no difference to the rate of carbonisation which the engine developed.

I should not like any of your readers to draw a conclusion that the Velocette shows a special tendency to carbonisation; on the contrary, it has shown marvellous qualities. I am using it every day in all sorts of weather, and for solo running and reliability this little machine has given me every satisfaction.

G. BOURCIER.

### Floatless Carburettors and Amateur Historians.

Sir,—I was amazed to read in a motor cycling journal a week or two ago a correspondence with regard to spray carburettors without float mechanism. The writers were apparently under the impression that a carburetor without a float was something of a novelty, and one writer, contradicting another as to the time when these were originated, stated that he knew of one as far back as 1909. I can perhaps throw a little light on to this subject by telling you what you doubtless already know, viz., that a number of motor cycle spray carburettors were made without float mechanism as far back as 1900, and possibly there were some even earlier.

I remember one in particular which worked remarkably well. Broadly, it consisted of a needle and diaphragm. The point of the needle entered the spraying jet, and the lift was controlled by a screw device. The air opening remained constant, and one regulated the supply of petrol by operating the screw so that the needle could rise more or less. As the petrol issued from the jet hole it struck the diaphragm

of the valve on the under side, the chamber in which the diaphragm worked being a double cone, the largest diameter being around the diaphragm. The sides of the cone were corrugated, and helped to break up the petrol which was also still further broken up by being rapidly drawn round the edges of the diaphragm. It was called a diaphragm, but it was in reality merely a brass plate formed with the valve needle. You will understand that with the alternative ebb and flow in the inlet pipe the valve was rapidly drawn upwards and returned to its seating, but it was limited in its movement by the screw stops.

The explosions produced by this type of carburetor were particularly strong, showing that the mixture must have been very nearly perfect. The only trouble with it was that the arrangement for controlling the supply of petrol, although it worked very well, was not sufficiently finely graded to enable a novice to handle it with ease. It required a certain amount of knowledge as to what to do when approaching a hill. For example, if the valve were opened too far and the mixture thereby enriched too much, the engine failed. If commonsense were used this type of carburetor was very successful.

I could send you rough sketches of several spray carburetors of the floatless type which were fitted to early motor cycles; to talk of them as being novelties in 1909 is very far from the mark. It was thought in the early days that a float feed was unsuitable for a motor cycle owing to the extra vibration of rigid fork machines causing disturbance of the float mechanism. Events, however, have proved that the supposition was incorrect. Nevertheless, I still believe that it would be quite possible to make a perfect carburetor without a float feed, as the constant level could be maintained in another way and be quite satisfactory and very much cheaper.

OLD HAND.

### Spring Frame Design.

Sir,—As we read so much of late in your columns regarding spring frames I am prompted to ask: What is a "spring frame"? The query is, I think, justified when we have on the one side springing as used by the P.V. and Indian firms, and on the other side that of the Bat and Edmund type.

Although in the first instance the rear wheels are sprung in relation to the complete frame, and in the latter only the seat pillar is sprung, the back wheel remaining as in a rigid frame, each of these firms uses the term "spring frame." It is obvious that they both cannot truthfully claim the same term, even if they are of different types, as their principles, in the main, are so different.

I have opinions on the matter, and think that yours and those of your readers would be very interesting on what I consider the next big step in motor cycle construction.

H. A. STEYTLER.

### Hub Lubrication.

Sir,—I enclose a sketch of an improvement I have made for hub lubrication on smaller motor cycles, which I hope may be of some use to your readers.

There is little doubt that in the ordinary method of hub lubrication much dust and dirt accumulates round the lubricator, and is carried from there into the bearings. One

way of avoiding this is to have no lubricator, and remove the whole wheel to replenish with grease; but removing a back wheel is often a very tiresome business.

I have made an attempt to design a hub lubricator with a removable gauze filter attached, so that no dust or dirt can be carried into the bearings, and yet it can be replenished with oil on the spot. The lubricator is larger than usual, shaped like those on Bosch magnetos with the detachable gauze filter inside. Thus when dirt accumulates on the gauze it may be taken out and cleaned.

C. L. WHEATLEY.

We wish to call the attention of all users of E.I.C. Magneto  
(whether they be on Government Service or not) to the Guarantee  
as printed below.

E.I.C. MAGNETO GUARANTEE

## MAGNETO GUARANTEE

ISSUED BY  
THE ELECTRIC IGNITION CO. (1913) LIMITED.  
SAMPSON RD NORTH, BIRMINGHAM, ENGLAND.  
MANUFACTURERS OF  
THE E.I.C. MAGNETO

**This is to Certify** that we undertake to replace any part free of charge which (during a period of 12 months from the date on which the machine leaves our Works) breaks down or unduly wears due to faulty workmanship or material. Providing that the magneto is returned to us complete, carriage paid and make of machine from which it has been removed stated. It is to be understood also that our guarantee does not hold good if the magneto has been disassembled, i.e. end-plates or magnet removed.

In the event of any failure to give satisfaction occurring which cannot be righted by simple adjustments as set out in our instruction leaflet, the magneto should be returned to us intact, together with full name and address of sender, which should be attached to magneto, also a letter stating all required particulars regarding same sent per post.

Address all such parcels or letters to:-  
MAGNETO REPAIR DEPARTMENT  
THE ELECTRIC IGNITION CO. (1913) LTD.  
SAMPSON ROAD NORTH,  
BIRMINGHAM.

Signed for and  
on behalf  
of the Company \_\_\_\_\_  
Directors

This Guarantee was not issued till late in 1915, therefore there may be some users of E.I.C. Magneto who have not received same. The Guarantee is now enclosed in Instruction Booklet, both of which we wish every user to have in his possession.

The Instruction Booklet contains useful information, and the Guarantee is a true British Guarantee which ensures prompt attention and free replacement or repair of any part that may cause trouble due to faulty workmanship or material.

**EVERY E.I.C. MAGNETO MADE SINCE  
AUGUST, 1914, WE ACCEPT AS BEING  
STILL COVERED BY OUR GUARANTEE,  
ALTHOUGH GUARANTEE IS ONLY  
FOR TWELVE MONTHS.**

**We are standing behind our Goods, that's why.**

This advertisement is merely for the purpose of asking all who possess an E.I.C. Magneto and not the Guarantee and Instruction Booklet to send their name and address to—

## TWO-STROKE DESIGN.

**A**LTHOUGH this branch of internal combustion engineering is nearly as old as its four-stroke rival, it is not by any means in such an advanced stage. Comparatively little written matter on this subject exists at all, and that which does exist differs widely in opinion. Taking a certain piston displacement as a basis to work upon, it is evident that it is possible (theoretically) to convert twice as much fuel into energy with a two-stroke as with a four-stroke. At low speeds this may be very approximately the case, but as the speed increases the value of  $\eta p$  falls considerably in types which have piston-operated ports, and which rely on crank case compression for recharging the cylinder. With four-stroke engines the value of  $\eta p$  at high speeds is almost entirely dependent upon the efficiency of the valve mechanism, and as the charging periods are roughly  $200^\circ$  in the four-stroke to  $90^\circ$  in the two-stroke, it will be seen that volumetric efficiency, important as it is in the former, is doubly so in the case of the latter. There seems to be great diversity of opinion as to what is the ideal pressure at which the charge should be admitted into the cylinder.

It is possible, by means of disc cranks and the use of a differential or stepped piston, with a closed end to obtain crank case compression ratios of 3 to 1 and over. This, coupled with a large port opening, undoubtedly makes for a good volumetric efficiency, even at moderately high speeds.

The much-talked-about stratification of gases, by which it is claimed that the induced gas keeps to one side of the cylinder, forcing the exhaust gas in front of it, is very often a myth.

If stratification is obtained at high speeds it is absolutely lost at low. This is easily proved by the amount of unburnt gas which passes into the silencer with the exhaust, and which greatly accounts for the excessive consumption of some of these small engines.

The exhaust port, being of necessity uncovered first, is left open after the transfer port has closed and further helps this waste.

Again, the intake port to the crank case is open for a very short period only, and operates on the carburettor in a series of violent staccato sucks. Owing to the great difference in inertia between the petrol and air column it will be seen that at low speeds a large amount of fuel will be lost due to the continued spraying of the jet after the port has closed. The mixture will want careful variation to suit different speeds, which is amply substantiated by the fact that it is quite an art in lever manipulation to make some engines two-stroke at low speeds.

Again, condensation of petrol vapour occurs in the crank case, and having a great affinity for oil it soon helps to diminish the latter's lubricating qualities.

Of course, the great advantage of this type of engine is due to its simplicity, a highly desirable feature in all engineering products, but it seems to the author that in the pursuit of this ideal not enough attention has been paid to the essential.

### Points to be Considered.

As regards future developments. If the two-stroke is to be developed for car requirements, and also for high-powered motor cycle construction, as it undoubtedly will be, some methods will have to be devised which—

- (1.) Keep a good value of  $\eta p$  at high speeds.
- (2.) Economise fuel.
- (3.) Admit of automatic carburation even at greatly varying speeds.

The possibilities of the differential or stepped piston for pre-compression of the working charge have by no means been given a fair trial. The engine would, of course, have an even number of cylinders, and the pre-compression space of one cylinder would be coupled up to its neighbour, cranks being at  $180^\circ$ .

By using aluminium alloy the extra dimensions of the piston do not give any weight troubles, especially as the shaft speed of a two-stroke need not be as high as that of a four. The gudgeon pin can be placed low down and the end closed, as the larger portion gives good wearing surface for any side pressure due to angularity of the connecting rod.

Scavenging may be by pure air, and the fuel admitted in a liquid state under pressure as in a Diesel, the chief trouble here being to arrange a pump which will deal with small enough quantities, about .05 c.c. per stroke at full load on a 85 mm. x 88 mm. engine.

### Concerning Cooling.

If the design of the engine gives a value of  $\eta p$  similar to that of a four-stroke at a corresponding speed, say 70 lb. at 2,500 r.p.m., water-cooling will become a necessity—the lower value of  $\eta p$ , and therefore the smaller amount of heat generated, being the only reason why it has not become universally employed at present.

As regards balance, the four-stroke has an unbalanced primary force, while the two-stroke has an unbalanced couple. To keep this as low as possible the cranks should be kept close together and fitted with balance weights.

In conclusion, it may be said that in the author's opinion the head of the cylinder is the best place for admitting the fresh charge, by means of some suitable valve, and through a belt of ports situated all round the cylinder, thus avoiding as much as possible a streaky mixture. The piston could thus be dome-topped and the exhaust released through a similar belt uncovered at the bottom of the stroke.

A. C. WICKMAN.

\* An engineering term—mean effective pressure x mechanical efficiency.

# PATENTS.

Abridged by ERIC W. WALFORD.

## The Latest Brampton Fork.

As was the case in the original construction, the fork girder A is connected to the lower part of the steering column by a pair of links B, and the same springs C are employed to take the vertical load. In the present construction, however, the single upper resilient connection is replaced by duplicated link members D, which afford greater lateral stability. One link D is shown in detail in the small view. It is provided with an eye E at one end for attachment to the steering column, and at the other end it is screwed. Upon the link are springs F and G, between which is a slide H attached to the upper end of the fork girder. The springs and slide are retained in place by a helmet nut J screwing upon the threaded end of the

link. The operation is the same as in the original well-known pattern, an up-and-down motion being afforded by the links B, whilst the slide H permits a certain amount of to-and-fro motion under restraint of the springs F and G. —H. S. Yoxall and J. J. Richardson, No. 17,583, 1914.

## An Auxiliary Driving Wheel.

One of the earlier forms of application of a motor to a cycle was the Singer motor wheel, in which the engine, tank, etc., were arranged within the circumference of a wheel, which could either be used at the front or the rear. The construction here illustrated comprises a complete wheel and power unit, but in this case the engine and gear are arranged outside the wheel and on either side of the frame. The crank case A is provided with limbs B whereby it is attached to the stays C after the ordinary rear wheel has been removed,

The crankshaft is extended to carry the flywheel D on the opposite side of the wheel to the engine, and the hub of the wheel E is driven through change-speed gearing, the final pinion only of

which is illustrated at F. The disposition of the main parts is clearly shown in the side view. —Auto-Wheels, Ltd., and A. M. Pooley, No. 22,165, 1914.

## Rear Stand Improvement.

The stand A itself is of the ordinary kind, and is pivoted to the chain stays as usual. The invention lies in the operating mechanism, for which purpose there is employed a cable B passing over a pulley C, and attached at one end to the stand A and at the

other to the operating mechanism shown in the smaller drawing. This mechanism is located on the top tube, and comprises a spool D, on which is wound the cable C. At one end the spool is connected to a spiral spring E, whilst at the other is a winding device F and a locking band G. The construction is such that in operation, assuming the stand to be in the raised position, the spring E may be wound up and locked. When it is desired to drop the stand, the band G is freed, allowing the spool to rotate, paying off the cable B, and permitting the stand to fall. To raise the stand, the spring E (which, as

stated, has been previously wound) is caused to rotate the spool in the requisite direction for winding up the cable B, whereby the stand is raised. No actual manual operation is therefore required by the stand itself. —J. M. Herrington, No. 8,027, 1915.

## Roller Big-end Bearings.

Where a two-throw crankshaft is employed, and it is desired to use roller bearings for the big ends of the connecting rods, it is usually necessary for the crankshaft to be of the built-up

type. The construction illustrated, however, enables a single piece shaft to be employed. The shaft A is case-hardened, and the crank pins B themselves form the inner races for the rollers. The outer races C are constituted by the enlarged ends of the connecting rods, and the crank webs are bevelled as shown at D to enable the big ends to pass over them into position around the crank pins. The big ends are narrower than their pins, in order to afford sufficient space for the rollers E to be passed into position. The clearance is then taken up by the insertion of split filling pieces F, which are assembled on the crank pin and locked by grub screws G. —G. E. Bradshaw, No. 24,190, 1914.

## READ !

### MY 3-PHASE JET DAMPING CARBURETTERS

have such perfect vapourising properties that they enable you to use fuel at 1/- per gallon in 42-gallon casks, which you are allowed to keep on your premises. Your engine will tick over dead slow, and pull dead slow in traffic, yet give the full power. It is almost impossible to tell you are not running on petrol at 2/6 a gallon. It cannot damage your engine or soot it up, and makes Motor Cycling possible in these times.

I give you my personal assurance of the truth of what is stated above. Please send at once for full particulars of the carburetter, and also for my Treatise on Carburation, and terms of One Month's Approval Trial.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **LILFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money is deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding 10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Lilffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

### A.J.S.

**A.J.S.** 6-h.p. Combination, 1916; £102/18; exchanges considered.—Campion Garage, London Rd., Derby. [2621]

**A.J.S.** 5-h.p. Twin, coachbuilt sidcar, perfect condition; £35.—Ireland, Sankey, Warrington. [2659]

**1912 A.J.S.**, 2½-h.p., 2-speed, clutch, good condition; bargain, £17/10.—Box L1,020, c/o The Motor Cycle. [2882]

**A.J.S.** 4-h.p. Combination, absolutely new, unsold; note price, £87.—Haworth, 42, Burlington St., Blackburn. [2580]

**A.J.S.**, 2½-h.p., 1915, expensive speedometer, lamp, etc., only ridden 300 miles; £47.—Campion Garage, London Rd., Derby. [2622]

**A.J.S.**, 1914, 2½-h.p., 2-speed, clutch, kick starter, complete, accessories; £38.—Pocock, 46, Lewin Rd., Stoke Newington. [2679]

**A.J.S.** 4-h.p., and sidcar, 1916 model, just delivered, £93/17; also 1916 2½-h.p. model, £98.—Turpins, 22 and 29, Preston Rd., Brighton. [0716]

**1914 A.J.S.** Combination, not used since September, 3 Lucas lamps, dissolved acetylene outfit, 2 extra Lucas generators, excellent condition; £65 nett.—Haworth, 42, Burlington St., Blackburn. [2578]

### Alldays.

**SHREWSBURY** Agent for Allons; all models in stock.—J. C. Pickering. [X3444]

**ALLON**, 1915, 2-speed, clutch, all in very good condition; £35.—Redfern, Honiton, Devon. [X5389]

**1914 Alldays** Matchless, 2½-h.p., 2-stroke, 2 lamps, accessories; £17.—111, Grove Lane, Camberwell. [2646]

**ALLON**, 1916, 2½-h.p., 2-speed, not run 30 miles; a snap; £36.—Ideal Cycle Co., Thundersley, Essex. [2755]

**3½-h.p. Alldays** Roc 2-speed gear, complete, tools, and 2 accessories, just overhauled; £20.—Elley, Motors, Ladbury. [X4652]

**ALLDAYS** Allon, all models: immediate delivery; easy terms 2½ extra.—Referee Cycle Co., 332, High Holborn. [0763]

**1915 Allon**, 2½-h.p., 2-stroke, countershaft drive, all accessories; £25.—Wilkins, Boot Stores, High St., Edgware. [X5209]

**ALLDAYS** Allon, 2-stroke, 1915, as new, with accessories; £27, or near offer.—99, Nightingale Lane, Balham, S.W. [2672]

**ALLON**, 1915, 2-speed, 2-stroke, tyres and condition absolutely perfect.—Dove, Pleasureton, Northumberland Av., Gosforth, Newcastle. [X5432]

**ALLDAYS**, 3½-h.p., 3-speed, chain drive, coachbuilt sidcar, built Sept., 1914, with all accessories, in splendid condition; price £40.—Telephone: Barnet 5471. [2577]

**ALLDAYS** Allon, 1916 model, 2½-h.p., 2-stroke engine, countershaft 2-speed, luxuriously fitted with black finished lamp, horn, and speedometer, ridden 20 miles; cost £48; private owner, will accept £35.—Ideal Cycle Co., Thundersley, Essex. [2676]

**ALLDAYS** Allons, all models from stock; we give special attention to the requirements of novices; deferred payments by mutual arrangement; also 1915 Allon single-speed £27, and 1916 2-speed clutch model £75.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [2765]

## MOTOR CYCLES FOR SALE.

## Alldays.

1915 Allon 2-stroke, and Watsonian coachbuilt featherweight sidecar, lamps, horn, etc., only ridden 800 miles, excellent condition: £35.—3, West St., Ditchling, Hove, Sussex. [2575]

3 1/2 h.p. Alldays and Sidecar, with 2-speed, free engine, 2 new tyres, and belt, Bosch mag., B. and B. carburettor, adjustable pulley; must be sold; nearest £30.—Estate Office, Bonaces Rd., Edmonton, London, N. [X3997]

ALON. 2-stroke, 2-speed, clutch model, supplied new in December, 1915, very little used; 34 gns., very great bargain.—Julians, Broad St., Reading. Biggest motor cycle and light car dealers in the South. 45 years' reputation. 'Phone: 1024. [X4813]

## Antoine.

ANTOINE, 1912, 3 1/2 h.p., good condition: £12.—G. W. Lavington, Leighfield, Pollards Hill East, Norbury [2559]

## Ariel.

1915 3-speed Ariel, kick starter, accessories: £48.—Whiting, Castlethorpe, Bucks [2681]

ARIEL. 5-6 h.p., 1914 1/2, coachbuilt sidecar, kick starter, in perfect condition, new tyres; accept £60.—Williams, 65, Wydelhurst Rd., Addiscombe, Croydon. [2590]

## Arno.

3 1/2 h.p. Arco Combination, 1913, good order, new tyres and belt;—bargaie, 20 gns.—18, South Bruton Mews, Bond St., W. [2784]

## Auto-Wheels.

UTO-WHEEL De Luxe; £15/15, 25/3 monthly.—See at 248, Bishopsgate, London. [2827]

UTO-WHEEL, perfect running order, £27/10.—F. Deeming, 53, Loog St., Atherton. [X5505]

UTO-WHEEL; bargain to immediate purchaser, £4/10, first cheque.—Poole, Tullamore. [X5454]

1915 Auto-Wheel De Luxe, £15/15, very little used; £9/10.—Compton, Elmswell, Bury St. Rd. [X5525]

UTO-WHEEL, 1915, late model, unscratched, can be seen running, guaranteed, £8/8.—Geo. Smith, 268, Laveador Hill, Clapham Junction. 'Phone: Battersea, 1271. [2901]

UTO-WHEEL, with Humber bicycle, complete; a bargain at £12; in perfect order, shock absorber fitted; on view in Crordou; owner going abroad.—Shirehampton, Ninehams Gables, Caterham. [X4708]

## Basil.

BASIL-J.A.P., 1913, 4 h.p., 3-speed, clutch, beautiful machine; £25.—Speechley, 45, Church Rd., Acton. [X5420]

## Bat.

BAT, 1914, 8 h.p., T.T., 3 speeds, countershaft, speedometer, in real good order; £36.—Percy and Co., 337, Euston Rd., London. [2732]

1914 Bat-Jap, 5-6 h.p., Millford sidecar, wind screen, hood, 3-speed, kick starter, 3 lamps; £55; excellent condition.—Haworth, 42, Burlington St., Blackburn. [2582]

BAT-J.A.P., 8 h.p., 1915 B. and B. carburettor, Sturmeys 3-speed, coach sidecar, excellent condition; £45.—Rushdon, 1a, Harberson Mews, Harberson Rd., Balham. [2853]

1914 Bat-Jap, 8 h.p., Montgomery coach sidecar, little used, 3 speeds, French grey, will ride within 20 miles Walwyn; £45 cash; must sell.—Martin, Whitwell, Welwyn, Herts. [2617]

BAT, 5-6 h.p., late 1915 model, countershaft 3-speed gear box, spring frame, J.A.P. engine, lamp, horn, spares; cost £30; all as new, only done 250 miles; accept £65.—Buxter, Waratah, Lower Walton, Warrington. [X5211]

BAT-J.A.P., 1914, 6 h.p., special 85-64 1/2 overhead valve engine, 3-speed gear, kick-starter, T.T. model, Kempshalls, little used, in quite new condition, and very fast; £45.—Wallis, 49, High St., Saffron Walden, Essex. [X5492]

1914 5 h.p. Bat, coach sidecar, Armstrong 3-speed, clutch, Bosch, Amac, with Pilot jet, spring seat, luggage carrier, 2 front lamps, electric rear lamp, many spares, bought Jan., 1915, perfect condition; £50; exchange Harley-Davidson, Matchless combination.—28, Mitcham Rd., Tooting. [2616]

## Blackburne.

If you prefer the *Kanker* article, see our advertisement under *Excelsior* (American).—Laytons' Garage, Bicester, Oxon. [X5403]

**ENFIELDS**, all models delivered from stock. To tradesmen who are short staffed, let us quote and demonstrate one of our commercial combinations; deferred payments by mutual arrangement. Also 1914 6 h.p. combination reduced to £60, and 2½ h.p. 2-speed £26.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [2763]

**ROYAL Enfield New Combination**, 6 h.p. and 8 h.p., 6 chain driven machines, fitted with handsome coachbuilt sidecar, countershaft gear and free engine, up-to-date turnout, complete with storm apron; 85 gns.; tuition free, and free delivery to any address within 50 miles of London; best terms for cash, exchange, or extended payments.—Wanchope's, 9, Shoe Lane, London. [X5483]

## Fafair.

**3 h.p.** Fafair-Chater, Senspar, Palmers, Whittle belt; bargain, £5.—7, Arundel Rd., Dorking. [2855]

## F.N.

**F.N.**, 2 h.p., good condition, mag.; £9.—Rowlands, opposite Chalk Farm Tube Station. [2569]

**F.N.**, 5-6 h.p., 2 speeds, clutch, good condition throughout; £15/10.—Stiles, St. Andrew's, Norwich. [2775]

**F.N.**, 2½ h.p., countershaft 2-speed, clutch, splendid order throughout; £14/10.—Speechey, 45, Church Rd., Acton. [X5419]

**1914 F.N.**, 4-cyl., 2-speed, kick starter, coachbuilt sidecar; bargain, £45.—The South Essex Motor Co., High Rd., Ilford. [X5274]

## Grandex.

**GRANDEX-PRECISION**, 1916, 2-stroke, 2½ h.p., quite new; listed £34, for £31; fine model.—Grandex, 86, Gray's Inn Rd., W.C. [1705]

## Harley-Davidson.

FOR Harley-Davidsons, see below.

**HARLEY-DAVIDSON**, model F; £68/5.—The Premier Motor Co., Birmingham.

**MODEL J**, with dynamo lighting outfit; £76/13.—The Premier Motor Co., Birmingham.

**YOU** Save over £12 by purchasing direct from The Premier Motor Co., Aston Rd., Birmingham.

**SIDECARS** for Harley-Davidsons. We save you money. Immediate delivery.—The Premier Motor Co., Aston Rd., Birmingham. [2550]

**1916 Harley-Davidsons**, all models in stock.—Parker and Soo, St. Ives, Hunts. [2858]

**SHROPSHIRE** Agent for Harley-Davidsons; 1916 models, delivery from stock.—J. C. Pickering. [X5448]

**HARLEY-DAVIDSON** Models in stock, complete with Gloria sidecar.—Turpin, 22 and 29, Preston Rd., Brighton. [0713]

**HARLEY-DAVIDSON**, Model 11C, with coachbuilt sidecar, late 1915, quite new; £58.—Salter, 55, Old Kent Rd., S.E. [2566]

**HARLEY-DAVIDSON**, model 11F, 1916, 3 speeds, sidecar, Stewart, horn, lamps, new August; £70.—Bond, 245-247, Euston Rd., N.W. [2653]

**HARLEY-DAVIDSON**, 1915, 7-9 h.p., 2 cyles, 3-speed, electric lamps and horn, splendid condition; best offer above £60.—7, Stanhope Rd., Sidcup, Kent. [2667]

**HARLEY-DAVIDSON** model 11J, only slightly soiled, complete with new 20 gn. Gloria coachbuilt sidecar; £80.—The Premier Motor Co., Aston Rd., Birmingham. [2896]

**HARLEY-DAVIDSON**, 7-9 h.p., with best Gloria sidecar, purchased Aug. 1915, only run 500 miles, quite equal to new; £75; owner called to colours.—Macintosh, 14, Victoria St., Wolverhampton. [X5345]

FOR Best Terms and earliest delivery, place your order with the firm who introduced the *Silent Grey* in the Midlands. We offer the model P 7-9 h.p. Harley Davidson 3-speed at £68/5, or the model J with dynamo electric lighting equipment £76/13; delivery same day that order is received. Carriage paid to any address. Tuition free if required. Get in touch with us now and save money.—The Premier Motor Co., Aston Rd., Birmingham. [2071]

## Henderson.

**IMMEDIATE** Delivery from stock of the new 8-10 h.p. 4-cyl. Henderson, the all-weather motor cycle, 82 gns.; exchanges arranged; trial run and tuition free.—The Premier Motor Co., Aston Rd., Birmingham. [2531]

**1915 Henderson**, 10-12 h.p., 2 speeds, handle-bar clutch, Stewart speedometer, 5 h.p. lamp, 5-late exhaust whistle, horn, and rear light, run 600 miles, tyres, unworn, perfect; 59 gns.—Troward, Heathurst, Vale of Health, Hampstead. [2883]

## The Prohibition of Imports.

**W**E announced last week the Board of Trade's decision to prohibit the importation of motor cars and motor cycles for private uses. This new Order follows quickly upon the imposition of the 33⅓ per cent. import tariff levied upon foreign-made machines last October. The total prohibition, severe as it is from the agents' point of view, is not nearly so drastic a measure as it would have proved a year ago, when considerable quantities of motor vehicles were being imported (the 1915 motor cycle imports were £263,323). Of late the value of imported motor cycles has been affected by the usual winter slackening period, but the advent of spring has provided some amount of stimulus. The chief demand for machines comes nowadays from business men over, and young men under, military age. But quite apart from civilian buyers of motor cycles, there is an increasing demand from the thousands in khaki, particularly officers, who find that a motor cycle is almost indispensable when they wish to reach home or the nearest town from the camp at which they may be situated. Agents are the chief sufferers by this new edict. They will be robbed entirely of American machines as soon as the stocks in this country are absorbed, and dealers are already suffering from the greatly reduced supply of British machines. The decision, however, must have been foreseen in many quarters. We can express sorrow that this Order (unless it is merely a temporary measure) will rob all and sundry of the opportunity of seeing in being the latest productions of the States. It will be agreed that, much as we have taught the American manufacturer in the design of motor cycles—particularly in the early days—we have, on the other hand, to admit that in many points the Americans have shown us the lead.

But to turn to another important aspect of the question, we may enquire if the Board of Trade, in introducing so drastic a measure, has considered its likely effects upon British trade? It is clear that the go-ahead American will find a market for his wares, and, de-

prived of British patronage, the first move we predict will be to neutral countries in which British machines have hitherto been predominant, and, indeed, every country throughout the world where motor cycling is popular. So that, unless the Board of Trade is alive to the position and releases the fettered hands of our British manufacturers, America will be able to poach upon our preserves, so to speak, and the British manufacturer will be an irritated but helpless spectator. It will be conceded that home manufacturers do not wish for markets to themselves: fair competition is encouraged rather than otherwise, but, unless the Board of Trade rises to the occasion, it cannot be agreed that British manufacturers will be privileged to enjoy fair competition. Thus the Board of Trade slogan, "Capture enemy trade," becomes an empty phrase—mockingly empty, indeed, as it is within the bounds of possibility that we may not be able to retain our own trade connections.

We sincerely hope that men with business acumen who control the destinies of our trade will study this aspect of the question, and assist our manufacturers not only in exporting machines to maintain our rate of exchange, but to help to preserve those channels of trade which become more valuable as the weeks of war go by. The official Proclamation prohibits as from March 27th the importation of the following articles into the United Kingdom:

"Motor cars, chassis, motor cycles, and parts and accessories of motor cars and motor cycles (other than tyres), with the exception of the motor cars, chassis, accessories, and parts, which are at present exempted from import duty under Section 13 (4) of the Finance (No. 2) Act, 1915."

Business vehicles are thus free to enter the country upon a Board of Trade licence being obtained, for the point was made the subject of a particular application by *The Motor Cycle* to the Board of Trade in October last, when the 33⅓ per cent. duty was introduced. Large numbers are now employed by tradesmen and others who have given up their horses for Army purposes, and it is likely that the uses of the motor cycle sidecarrier will be considerably extended.

## A MOTOR RAFT.

Novel Use of a Motor Cycle Engine and Some Petrol Tins.

THE sporting and novel craft illustrated is the work of a former English motor cyclist who saw service in the German (now British) South-west African campaign, and who is now with the Union Forces in the East African fighting. His name is J. Dutton, and before the war he was for some time with the Austin Motor Company at Northfield, Birmingham.

Dutton built his boat during a spell of civilian work in the Transvaal, in the interval between the two African campaigns. A number of petrol tins and a single-cylinder Griffon motor cycle engine form the essential parts. The former were soldered together, and a bow and stern fitted. The engine is started by a cord round the belt pulley. Unfortunately, Dutton has not sent further constructional details, but we presume, from mention of a universal joint, that the engine drives a propeller direct *via* a car-type cardan-shaft. However, we are told that the outfit has proved a great success, and the builder has explored many miles of the Vaal River, besides spending a three weeks' holiday on it. The latter was particularly pleasurable. Light luggage, guns, and fishing tackle were stowed on board, and a most enjoyable time spent. One great advantage of this raft is its lightness—it can be lifted easily by two people.

This is yet another instance of the adaptability of the ordinary motor cycle engine. The war has shown this point up very strongly, but, in addition to military uses, motor cycle engines are employed for driving grindstones, bob sleighs, and now a home-

Mr. J. Dutton's motor raft, constructed with petrol tins and a single-cylinder Griffon motor cycle engine.

made raft. And there are other uses as well, the instances given being set down off-hand.

Motor cycle bob sleighs are very popular in the United States, and we have already illustrated many types, but climatic conditions prevent (to any extent) the same sport in England. However, this does not stand in the way of "motor rafting," and anybody wanting a change of recreation this summer can be recommended to follow Mr. Dutton's example.

Dutton, by the way, once had a very exciting, not to say unpleasant, ride from Johannesburg to Bloemhof. His mount was a single-gear B.S.A., and he nearly died on the veldt from thirst. His machine got badly sand-bogged, with no signs of habitation or any living thing in sight, and Dutton considers that he was saved by the water in the acetylene generator.

We wish to thank Capt. H. L. Smith, A.S.C., M.T., for forwarding us the photographs and particulars relating to the raft. Dutton served with Capt. Smith in the German South-West African campaign.

### DUBLIN TRIAL RESULTS.

THE awards and marking in the St. Patrick's Day trial of the Dublin and District Motor Cycle Club to Glendalough and back, reported in our last issue, are as under:

#### SILVER MEDALS.

	Marks.
R. Armstrong (8 h.p. Enfield sc.)	100
G. McKenzie (5 h.p. Indian sc.)	100
S. Morrogh (2½ h.p. Douglas)	100
S. Allen (3½ h.p. James)	100
D. Allen (2¼ h.p. Sun)	100
P. H. Hurse (4¼ h.p. B.S.A.)	100

#### BRONZE MEDALS.

M. Fennell (4 h.p. Norton sc.)	98
L. Carter (7-9 h.p. Excelsior sc.)	97
M. Keegan (3½ h.p. Triumph)	94
S. Redmond (3½ h.p. Indian)	94
C. S. Kettle (4¼ h.p. B.S.A. sc.)	93

The motor raft "all out" on the River Vaal, Transvaal.

# Occasional Comments by "Ixion"

## Horizontal Twins in Winter.

One of the intrinsic peculiarities of the horizontal twin is that it must necessarily have a long induction pipe. If the air supply is not heated in any way, irregularities must occur in the mixture during winter until the metal gets warmed up by conduction from the cylinders, as the petrol condenses whilst passing along these cold pipes. If freezing troubles are experienced in cold weather, it pays to lag the induction piping in felt; or if a hot air supply can be arranged, the jet size can usually be reduced, and some economy of petrol effected.

## Against Top Feed Carburetters.

Judging from my correspondence, there is a very considerable prejudice amongst riders against the new design of carburetter, though the trade remains obstinately silent. The following objections are reiterated *ad nauseam* by my correspondents:

1. Inaccessibility.
2. Constant choking of filter gauzes.
3. Frequent absence of any provision for lowering petrol level (often wrongly set); several riders have put washers under the jet.
4. Liability of float chamber lid to turn when spanner is applied to petrol union.

## Some Air-cooling Experiments.

When the Rudge and other firms began to place the inlet valve overhead of the exhaust valve, I suggested that the reverse placing might be superior, on the dual ground that the hot exhaust valve would be further away from the cylinder, and so reduce lop-sided heat distortions, and that the exhaust valve gave more trouble than the inlet, and therefore shrieked for the more accessible position, when one valve had to be rendered comparatively inaccessible. Mr. Bradshaw, writing in *The Autocar* on March 18th, ascribes the success of the latest A.B.C. engine in no small measure to the fact that the exhaust valve is overhead; it thus gets the maximum cooling, and that without feeding back its surplus heat into one side of the cylinder, and so tending to warp the cylinder. Incidentally, the exhaust valve has a detachable seating, so that valve and seat can swiftly be spun true in the lathe. I do not think I have enjoyed this particular convenience since I drove an Ariette. I wonder how many readers remember the Ariette—a revived and improved Leon Bollée—which blossomed for a few interesting months at the height of the original tricar boom about 1906.

## Mr. Bradshaw on Piston Design.

Mr. Bradshaw is also very interesting on piston design. Like all high-speed riders, he knows that when you have succeeded in getting a cylinder that does not distort under heat, the next job is to keep your piston round when its top is nearly red-hot. He knows two methods of doing so. The first is to over-oil, which he rightly pronounces extravagant, adding

that it accumulates lumps of burnt oil inside the piston and spoils the balance, whilst further tending to overheating; the second is to conduct the heat away to the cylinder walls, which method he adopts. I timidly inform him of a third, which I personally have employed for years; perhaps he will mock at it. I distort my new pistons when I take over a new machine by driving the engine rather blue; and at frequent intervals I take out the piston and find it is no longer round, some of the distortion remaining after cooling. I true the piston back into rotundity with a great file, distort it again, and so on until the piston seems incapable of further distortion.

## Where the Two-stroke Scores.

In contrasting the future possibilities of the various types of lightweight, it must not be forgotten that the two-stroke gives more power than a four-stroke of the same c.c. for the simple reason that it has a firing stroke for every revolution, as against the one firing stroke per two revolutions of the four-stroke. On the other hand, it does not give double the horse-power developed by a four-stroke of the same c.c. because it cannot inhale so large a charge, seeing that its suction period is shorter, and efforts to supply it with forced induction have so far introduced compensating disadvantages. Broadly speaking, if a 300 c.c. four-stroke gives 3 h.p. at maximum efficiency, a 200 c.c. two-stroke will give 4 h.p. at the same rate of revolution. As some reserve of power is especially valuable with tiny engines, this point gives the baby two-stroke a real scoop in the forthcoming battle.

## Petrol Lubrication and Carburation.

I question whether recent correspondents lay sufficient stress on the interference of oil in the carburation of two-strokes, more particularly when they are lubricated by the "petrol" system, and especially so when the inlet port is adjacent to the carburetter. Whatever method of oiling such engines is employed, the piston can be relied upon to keep both the ports by which mixture reaches the cylinder (*i.e.*, the mouths of the transfer pipe and of the inlet pipe proper) dripping with oil; and certain dispositions of these ports enhance the trouble considerably. Indeed, one eminent firm of carburetter designers actually avoids supplying carburetters to certain types of engine as far as possible, seeing that the design effectually prevents the best carburetter from securing two-stroking at low speeds.

While I am on the subject, here is a very simple puzzle for novices to diagnose. The other day some idiot flooded the crank case of my "baby" with oil. When the machine was wanted, I started the engine up and let it run free to clear out the oil as a quicker method than taking out the drain tap. Almost instantly a tall geyser of mingled oil and petrol spirted a yard high from the vent hole in the petrol tank stopper. Why?

## THE HUBS OF MOTOR CYCLES.

HOW THEY HAVE BEEN IMPROVED AND MADE MORE WEATHERPROOF TO MEET MILITARY AND OVERSEAS REQUIREMENTS.

**"N**OTHING is stronger than its weakest part," and the many letters, which we have received from the various war zones and elsewhere prove very conclusively that the hubs of many motor cycles are not what they should be either in the matter of wear or of weatherproofness. The former is, of course, largely influenced by the latter, as grit and water are certain to cause unsatisfactory service, but it is also to some extent due to the materials or their treatment falling short of what is required to make a really satisfactory hub. The balls themselves, if of sufficient size, generally perform their duty well, for they are made by experienced men with the greatest care and exactness. This is fortunate, for a broken ball when it does occur—and such a mishap is by no means unheard of when the balls are on the small side—plays havoc with the whole bearing. Sometimes the case-hardening of the cone does not extend deeply enough into the metal, with the result that as soon as the hard skin is worn through the surface becomes pitted, as it were, and uneven, after which satisfactory running is at an end, and it becomes impossible to adjust the hub correctly.

### Riders' Neglect.

In many cases the trouble is the fault of the riders themselves, for they do not take the trouble to adjust their bearings correctly, and rapid wear results owing to the hammering of the parts. A badly adjusted wheel also more readily admits of the ingress of dirt and water. This stricture applies more to men at the Front, despatch riders and others, who do not own the machines they ride and can usually obtain small renewals, which are fitted by the artificers for the asking. It must be urged in their excuse that their time is often very fully occupied in the service of their country, and that, when they return tired out from their arduous tasks, they can hardly be expected to spend their leisure on overhauling and adjusting their machines. Still if the hubs were perfect no adjustment would be necessary for several thousand miles; in fact, one well-known firm fits non-adjustable Skefko bearings to the detachable rear wheel, which shows that they have good reason to believe their hub to be capable of running a long distance without adjustment.

Front hubs are certainly more vulnerable than rear hubs, largely because of the smaller clearance. Mud and water run down the forks and quickly work their way into the bearings unless some sort of protection is provided; also, when the machine is at rest a certain amount of dirt may run down the spokes, with the same result. If the front mudguards were wider a large quantity of mud which now falls on to the forks and hub ends would fall clear of the wheel. We have often been amazed to find that so much dirt could be deposited all over front wheel bearings without finding its way inside. Some methods of excluding it are certainly very efficient, but still on many machines there is much room for improvement.

Part of the trouble is possibly due to the fact that hubs are in many cases not made or designed by the manufacturers of the machine to which they are fitted, but by the hub-making specialists, who sometimes find that cheapness is more profitable than high quality.

The Douglas hub which has disc adjustment.

### Hub Lubrication.

It has been generally found more satisfactory to lubricate hubs with some kind of grease or hub lubricant, as this in itself tends to exclude grit and water without the help of any special design, but it is not a very easy matter to get this grease into the hub through the small lubricator provided. Some arrangement to which a grease gun could be screwed seems to be desirable. Why not a hollow spindle with a suitable thread at the orifice which, when in use, would be completely covered by the domed nut already standard on several makes? This would be far less trouble than taking down the hub and repacking it with grease at the end of every 1,000 miles or so—a job which many riders are apt to postpone unduly, or even *sine die*.

### Some Good Examples.

Referring now to our illustrations of representative hubs: **The Douglas** is a disc adjusting hub, a little puzzling, perhaps, to a novice, but very efficient in use. It is very well protected by dust caps, and two felt washers are utilised on each side. This is the 1916 pattern, and we are not surprised to hear that it has been most successful in use and is giving good service at the Front.

Norton.

The Norton hub is built with a view to quick detachability; the axle upon which the cones are carried is hollow, and a solid spindle passes through it; when this is removed, which necessitates the undoing of only one nut, the wheel drops out. The weather-

proofing is

achieved, as in the Enfield, by a dust cap covering the end of the hub, a running clearance only being provided.

The Enfield is a well-tried pattern which has been in satisfactory use for some time. There is no felt washer, and it depends for its weatherproof effect upon a dust cap which covers the end of the hub. The balls are carried in cages and are of large size.

The Lea-Francis hub has many points of excellence. There is, first of all, a greater clearance between the hub and the forks than is found on most machines; that, as we have already explained, is a desirable feature, and would have a considerable effect in keeping the bearings clean, even if no other means were provided. Further, a felt washer is held in a gland nut which is screwed into the hub to meet the cone, and the hub is so constructed that very little grit should get even as far as the felt, and certainly none should pass it; this felt washer will also assist in retaining the oil. The gland nut also forms a groove on the outside of the hub, which should carry any water, which may run down the spokes when the machine is standing, away from the bearings. Lastly, the hub carries a lock nut and washer inside the fork, so that the adjustment is not upset when the wheel is removed for tyre changing purposes.

The Levis hub depends upon the dust cap, which does not cover the end of the hub but fits into a recess, to exclude the dirt. The makers have also found it better to discard oil nipples entirely, and to pack the hub with Price's hub lubricant. At the end of a couple of thousand miles the hub should be cleaned and repacked, but if time does not admit of this, oil can be injected at the sides, after all dirt has been carefully wiped away.

### The Triumph

hub was, until recently, weatherproofed in the same manner as the Norton, but, while that method was perfectly satisfactory at home, it was not found sufficient for despatch riding in Flanders and for the rough usage which machines must experience in the war zone. Therefore the end of the hub is now

slightly tapered, a shoulder is formed in the dust cap, and a felt ring inserted, which should be very effective, as it checks the dirt at its first point of possible ingress. Another point worthy of mention is that the cones are now made of Ubas steel.

The Indian is a beautifully finished piece of work. It is provided with a knock-out spindle which renders

the wheel easily detachable. After the balls are placed in position a flange is forced in over them which answers the triple purpose of excluding dirt, retaining oil, and keeping the balls in position when the cones are removed for cleaning purposes.

A dust cap is fitted at each end of the hub, and if this is filled with grease it should prove most effective. No felt washer has been found necessary.

It is not suggested that the few hubs we have illustrated by any means exhaust the examples of meritorious attempts at weatherproofing; for instance, the James Co., whose hub is not illustrated, employ an adjustable Timken bearing on their sidecar outfits. In this the dirt-excluding felt washer is placed much in the same way as in the Lea-Francis. Sufficient has been said, however, to show that the trade is paying attention to this very necessary matter.

Triumph.

## SIDECARRING FOR AN INVALID.

How an Inexpensive Outfit brought Health and Strength.

**P**OPULAR prejudice dies slowly, and to the majority of people the sidecar outfit is still an uncomfortable, dangerous, and terrifying vehicle, suited solely for frivolous and foolhardy "flappers," charioteered by break-neck "knuts." The more frequent appearance on our roads of the family outfit, with a lady and two, or even more, children in the sidecar, may do something to dispel the delusion; but if I tell my friends that I bought my sidecar at the doctor's suggestion, for the benefit of my wife's health, the statement is always received with more or less polite incredulity.

As the result of a street accident some years ago, my wife has been rendered delicate and unable to walk more than a very short distance. Influenza last winter increased her weakness, and its after results made her a prisoner indoors, too tired to get out for air, and too delicate for even the lightest of exercise. The doctor insisted that fresh air was needed, and a change of scene and occupation which would brighten the whole outlook, and help the body by cheering the mind. A bathchair was the only seeming solution, but we could not make up our minds to capitulate to that confessed sign of "invalidism." The doctor advised a car, or even a light cycle car, but inexorable ways and means forbade. "Why not try a sidecar, then?" persisted the physician. Here, at least, we were within the bounds of possibility, and we decided to make the attempt.

### Selecting the Machine.

The question was whether for about £60 we could secure an outfit, with an easy riding sidecar, that would hold my wife and small son, aged seven, who refused to be left behind. A big twin-cylinder combination would be too expensive. Would it be fair to load a

3½ h.p. single to this extent? I finally obtained a Quadrant big single, 4½ h.p., whose 565 c.c. of cylinder capacity gives just that extra pull that we needed compared with the normal 500 c.c. of the standard 3½ h.p. The next question was the sidecar. Could it be made to ride comfortably over the pot-hole pitted tracks that are called roads round London? Could the passenger be kept warm, dry, and sheltered? I obtained a roomy coach-built sidecar, with a body long enough to seat my small son comfortably at my wife's feet. A London firm fitted a windscreen, neat hood, and side curtains. Next came the problem of springing. The ordinary shackles were removed, and I fixed a pair of shock absorbing springs, similar to those fitted on motor cars. They cost 12s. 6d. A couple of air cushions, which I made by simply winding a cycle inner tube inside a cushion case, and moderately inflating it, provides seat and footstool. Thus fitted up we took to the road. We have given the outfit six months' trial, doing 1,200 miles over all sorts of roads. The passenger has had absolute comfort, whilst the heaviest rain has never penetrated the excellent little Cape cart hood. My wife has greatly enjoyed the trips we have made, and is certainly in better health. Small son has become an enthusiast who can recognise every make of motor cycle, and is impatiently awaiting the magic age of fourteen, when a cautious Legislature thinks he may be trusted to hold a licence. He has decided on a Douglas, so at least I am duly informed, and stray pennies are being carefully hoarded with that end in view.

### An Enjoyable Holiday.

The Quadrant engine has given no trouble whatsoever, and with our united weights—24 stone—and the heavy sidecar, has taken every hill, including a gradient of 1 in 5. We do not want high speeds, our average journey being done at about 18 m.p.h., but we have on occasion done "thirty-five" without requiring full throttle. A motor cycling holiday on the South Coast has been the feature of our summer. Choosing a convenient centre, we made daily runs each afternoon. Our distances varied from twenty to forty miles, according to weather and inclination. A Thermos flask of hot tea and a picnic basket made us independent of teashops, and many a glorious picnic we had by the side of the woods or on some upland common.

There must be many who, like myself, desire to

"Quadrider," writer of the accompanying article, and family on the Quadrant outfit.

**Sidecarring for an Invalid.—**

provide an easy and cheap means of locomotion for someone who is not blessed with much health. Let them try the sidecar; and fit it with really efficient spring shock absorbers. They will find it give comfort that is not unfairly to be compared with that of a car. What are the objections? Perhaps the prospective driver is middle-aged. Well, the present writer is approaching that sad fate, and, though an old cyclist, was wholly unaccustomed to motors. Learning to handle an outfit is not difficult. I had only two lessons, and drove with very little awkwardness at the first attempt. Accidents and breakdowns? I have had no accidents (I touch wood humbly!), and although no one is immune from the consequences of the mistakes of others, care and strict observance of the rules of the road will avoid most of the perils.

I have had my share of the incidental troubles of the motor cyclist, but we have yet to be stranded ten miles from nowhere, as most of our friends imagine

will be our daily fate. I was quite inexperienced and an unmechanical person, but I have speedily learned to do all ordinary repairs. I studied the admirable little manuals published by *The Motor Cycle*, and read that journal assiduously, going to the machine itself for practical illustration. I have watched whenever any repair has been executed for me, and it is never waste time. Experience is the best teacher, and even if you fail once, your failure generally helps you to success next time. I have had the joy of succeeding over a job the garage gave up, and one must admit the little triumph was sweet.

To sum up, sidecarring for an invalid is a practical proposition. Get a reliable machine with enough power, spend a little extra on luxuries for the sidecar, and there is no reason why the most delicate should not enjoy the lure of the open road. I can but hope that this article may bring to some other prisoner of ill-health the freedom, happiness, and interest of the glorious sport of motor cycling. **QUADRIDER.**

## SOME NOTES ON THE OPERATION OF TWO-STROKE ENGINES.

Observations and Opinions of a Practical American Designer who has closely followed the Movement.

**O**BSERVING, as I do, the general use of the two-stroke motor in England (as disclosed by a steady perusal of *The Motor Cycle*), especially in the lightweight machines, also in several instances in America, it pains me to read the statements of different contributors to your paper and to the American papers regarding the working of the two-stroke motors.

Now my intention in writing this is to start a controversy, because in so doing we all may learn something. I hope to give the learned and others something to think about for some time to come; yes, and to write about too.

### Many Experimental Engines.

Now, to begin with, I have built several designs of two-stroke motors—some large, some small, in fact as small as  $1\frac{1}{2}$  in. bore  $\times$   $1\frac{3}{4}$  in. stroke ( $38 \times 44\frac{1}{2}$  mm.) two-cylinder two-stroke for aeroplane models, and as large as  $3\frac{3}{4}$  in.  $\times$   $4\frac{1}{2}$  in. ( $95\frac{1}{4} \times 114\frac{1}{4}$  mm.) single-cylinder two-stroke, air-cooled, for motor cycles—and I feel that, on that account, I am in a measure qualified to make statements based on what I believe to be experience, and if I am wrong I am willing to be set right, but “I am from Missouri,” as they say in America, which means I will have to be convinced.

I will also add that I have built two-port motors with spring inlet check valves to crank case; three-port motors, no check valves; two-ports with gear-driven rotary valves; motors with revolving discs to crank case; and two diameter piston two-cylinder motors; so you see that in my experiments I have covered the field very thoroughly, and I will say right here that I found the rotary valve motor as built by me the motor that was most satisfactory and having the greatest possibilities.

Now a common statement made by writers in describing the action of a two-stroke motor is that,

after the charge of gas has been exploded and the piston driven down, the gas taken into the crank case on the up-stroke of the piston is compressed partially, and rushes up into the cylinder, thereby helping to expel the burnt charge of gas. Now I contend and hereby assert that such is not the case, and while I admit that assertion is not proof, I wish for the sake of argument to place the burden of proof on those who may feel disposed to take this matter up.

I will further assert that not only does the new charge not assist in expelling the old gas, but that there is a partial vacuum in the cylinder at that moment, which if taken advantage of assists materially in drawing in the new gas, and it will be found on close study that the essential difference between two motors—one poorly designed and one well designed—is that one takes advantage, either consciously or otherwise, of the aforesaid vacuum, and the other does not.

### Discussion Required.

So you will see that I, for one, do not subscribe to the general idea as stated above, and I sincerely believe that I will find several defenders in the long list of very able writers whose contributions I have had the pleasure of reading in this journal, and if I am successful in drawing these out I feel as though my purpose has been served, and we may cover a new field and spread a more general knowledge of what I consider the most ideal and simplest prime mover ever devised, and at the same time the least understood, and to this end I dedicate these few lines.

WILLIAM E. SLATER.

Will any reader who has devised an advance and retard fitting for the stationary firing point type of Dixie magneto kindly address a description, if possible with drawings, to the Editor?

# CYLINDER COOLING.

## THE GREAT INFLUENCE OF DESIGN AND MATERIAL.

OUR readers will remember that some little while ago—to be precise, on December 23rd, 1915—we published a review of a paper read by Mr. F. W. Lanchester on the important subject of cylinder cooling. This referred largely to the possibilities of air cooling if carried out on the right lines. On January 20th we supplemented this article with some account of auxiliary cooling devices as applied from time to time to motor cycle engines. This discussion has now been carried a step further, for our contemporary, *The Autocar*, published on March 18th an article from the pen of Mr. Granville E. Bradshaw, the talented designer of the A.B.C. motor cycle, which is of so much interest to motor cyclists that we have made many extracts from it for the benefit of our readers. He first relates how he decided that cast iron was by no means ideal for cylinder construction, and describes several methods of attaching cooling flanges to a plain steel cylinder, which were soon discarded. He then proceeds as follows:

Finally, the cylinders were machined from steel bar, with very thin fins of correct shape and spacing formed upon them during the process of machining; subsequently they were annealed to remove all internal stresses, cleaned, and copper-plated on the outside. The results were immediately successful from every point of view. The cylinder was light (the walls being only  $\frac{1}{16}$  in. thick), its capacity for cooling was remarkable, and it was found surprisingly cheap to manufacture. The cylinders were nickel-plated on top of the copper so as not to present an unusual appearance. As a point of design this arrangement is very good, because there is an excellent stiffening rib of steel to carry the copper fin.

The quality of the steel had some considerable effect on the results obtained, but not so much as one would at first expect.

After numerous experiments in this direction, a steel of from 40 to 45 tons ultimate tensile was found which gave the requisite glassy surface to the interior of the cylinder walls under the action of the piston and rings. This steel was reasonable in price, and suited to rapid production and efficient workshop methods.

### Konking made Impossible.

In the first cylinders made, the whole cylinder, including the head, was machined in one piece, and two overhead valves were fitted. These were carried in cast iron cages, of which the valve seatings were a part. Subsequently the valves were tried with their seatings in the steel of the cylinder, with equally excellent results and an absence of pitting. The cylinders had flat heads, with valve gear of the type found in a number of American cars, and shown in fig. 1.

That this design of cylinder was very satisfactory from the point of view of cooling is shown by the fact that a state of affairs had been reached in which it

was difficult to adopt the usual tests on this engine. The early tests had been made in the shape of long runs with very low air-cooling current, and on varying throttle openings from half to full load, then switching off without touching the

Fig. 1.—Early designs of air-cooled steel cylinders, copper-plated, and—with overhead valves and cast iron cages. The circumferential and axial ribs are alternative designs.

throttle and observing if the mixture would continue to ignite. These tests were altered to one of braking the engine down after a long run till "konking" occurred, but now a state of affairs was reached in which neither test was applicable, as it was found impossible to make the engine "konk" or continue to ignite. The compression ratio was increased, and eventually reached as high a figure as 7—1, which would be considered ab-

Fig. 2.—A later type of spherically-headed steel cylinder with the valves in cast iron cages.

normal even for the best design of water-cooled engine. Eventually four world's speed records were obtained on Brooklands track with cylinders of this design fitted to motor cycles.

In order to obtain increased power a new type of valve and cylinder head design was evolved. This is shown in fig. 2. In this the cylinder was again made of steel machined from the solid bar, with the combustion chamber hemispherical, and with the cooling ribs milled parallel to the cylinder bore. Cast iron exhaust and inlet cages were held on "V" seatings by large nuts, and an overhead camshaft was used. The design of cylinder, combustion chamber, size and disposition of valves and mechanical details, were all excellent.

It was another consideration, however, which caused the writer to commence radical alterations in design, i.e., public opinion. In air-cooled engines, the prevalent weakness is the breakage of valves. At one time a motor cyclist would have preferred to start his journey minus a tyre repair outfit rather than without a spare exhaust valve. And things are not much better in this respect to-day. Consequently it was found that 90% of the buying public would not use an engine in which a broken valve could fall into the cylinder and try conclusions with the piston head, and despite the fact that a large number of engines had been in the hands of the public for a considerable time, and (with one exception in the case of a purely racing engine) not a single valve had been known to break,\* the design of this particular engine had to be modified.

The exhaust valve had now to be situated in a pocket, in such a way that in the case of breakage the head of the valve could not fall into the cylinder. The only possible way was to fit a cast iron head, or numerous other considerations had to be sacrificed, and finally it was decided to fit superimposed valves with the exhaust valve over the inlet. Common practice with superimposed valves is to fit an overhead inlet valve with the exhaust valve as a side valve, as shown in fig. 3. This design is, however, often unsatisfactory on account of the warping of the cylinder due to the high temperature and the close proximity of the exhaust port to one side of the cylinder wall, and it probably accounts for the falling off in compression of this type of engine when it is hot. These remarks also apply to engines with both valves fitted as side valves.

### The Final Arrangement and the Reasons for it.

With the exhaust valve overhead, as shown in fig. 4, every disadvantage is removed and numerous advantages appear. The hot exhaust outlet (the hottest part of the engine) is taken right away from the cylinder walls and replaced by the cool induction port and valve seating. The exhaust port is, in fact,

\* The design of this valve was described in *The Motor Cycle* for June 3rd, 1915, page 531.

## making the by-ways highways

AN artist with a lively imagination drew this road—but most motor cyclists will be familiar with one very much like it. The boys in France and Flanders know plenty. It is a type of road and condition of surface that would be a positive bugbear if Avon Tyres were not equally well-known, but as things are one can afford to be philosophic and take whatever comes along with a light heart.

☛ Fitting Avon Tyres is equivalent to carrying one's own permanent way. They "make the by-ways highways" by gripping on all surfaces, neutralising shocks, and resisting, with tough tread and vigorous wall-strength, the lurking agents of destruction that abound on every road—good, bad, or indifferent.

☛ And the clinching argument for Avons is that they serve you at *lowest cost per mile*. No man gets the best out of motor cycling until he fits

*Stockists and Agents everywhere.*

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

Officer: . . . . . You can see the spot I refer to about 200 yards down the road just round the bend. We hadn't a dispatch rider available and the wires were down. It was absolutely essential that somebody should get through with instructions for the battery in action two miles further on. The road was in a terrible state, and as the beggars were searching it with shells at intervals of three minutes, I had to let the old 'bus' go all out. I put it down entirely to the fact that she was shod with Dunlop non-skids that she held a bend like that at such a pace. The tyres stand up to their work splendidly too.

Dunlop: That's most interesting, and only confirms the evidence I am gradually collecting that my patent rubber-studded motor cycle cover is considered *the thing out here*. Much obliged.

Extract from a letter of a motor-cyclist at the front: "We have several 2½ h.p. machines; two were fitted with - - -s and the others with Dunlops. The - - - tyres are worn out and have been replaced by Dunlops. The other Dunlops are still running."

**Cylinder Cooling.—**

isolated and in a position where it can have little effect on the heating of the remainder of the cylinder. It has air space all round to obtain the maximum of cooling, it cannot heat the lubricating oil on the cylinder walls, it retains the advantage of the superimposed valve design (*i.e.*, that of the cool inlet gases sweeping over the head of the exhaust valve and reducing its maximum temperature), and both the exhaust valve and its seating are very accessible and can be removed to a bench where they can be

Fig. 3.—A common type of cast iron cylinder with super imposed valves, the exhaust valve being parallel with the bore of the cylinder and the inlet valve overhead.

ground in under better conditions than bending over a hot engine. The position of the sparking plug for cooling and non-oiling up are also worthy of consideration.

This design of cylinder proved to be the most satisfactory in all respects, and, in fact, it appears very difficult to find any serious disadvantages in it. As far as the cylinder walls are concerned, they are assisted in every way, because, instead, as in the case of cast iron, of the fins having to be proportioned so as to render casting possible, they can be correctly proportioned to assist cooling, and made of superior heat-conducting material. They are also perfectly concentric, and, with no lugs or bosses, they are therefore not liable to distortion, so common in air-cooled cast iron cylinders.

This system of cylinder construction has proved so satisfactory that on engines up to 70 mm. bore it has not been found necessary to augment the conductivity of the steel with the copper deposit, consequently there is a considerable saving in cost.

**On Piston Design.**

In designing the piston, particular attention was paid to two points: cooling the head of the piston and maintaining the gudgeon pin and its bearing at a low temperature. Two methods of cooling the piston head are available. One is to use a plentiful supply of oil, which is extravagant, causes a heavy carbon deposit inside the head, and is bad for the rest of the lubrication of the engine, and the other is to conduct the heat away to the cylinder walls. The latter is undoubtedly the better.

In the writer's experience by far the greatest amount of heat is conducted by the piston rings, because these are more continuously in contact with the cylinder than is the piston, and two, three, or four rings are fitted according to the size of the bore. Four or six webs are cast across the piston head to assist in carrying the heat directly from the head to the rings.

 **Webs under the Piston Head.**

Many designers cast a web across the head of the piston and carry this down to the gudgeon pin bosses; this, however, is particularly bad, and the trouble has only to be exaggerated by trying the same design in an efficient air-cooled engine to convince one how bad it is. Even under ordinary circumstances the gudgeon pin bearing is by no means well situated as far as moderate temperature is concerned, and to conduct still more heat directly from the cylinder head to increase its worries is purely farcical. The object, therefore, is to keep the gudgeon pin as far away from the head of the piston as possible, as shown in fig. 5, and have no connecting webs.

**Aluminium Pistons and Cylinder Heads.**

The writer has, during the past few months, been using pistons of cast aluminium, with success in almost all details. For cooling they are excellent, but much more care has to be exercised in order to find the correct clearance, as too much is as bad as too little, but in any case they must be better in steel cylinders in this respect than in cast iron ones. Aluminium has, of course, a higher coefficient of expansion than steel, and, of course, still more so than cast iron. Numerous long tests have been made on full throttle with no cooling fan, and so far the aluminium pistons have not failed in any way.

As a further improvement, cast aluminium cylinder heads are being tried in place of the cast iron ones at present being used; so far the results are not sufficiently satisfactory to record them, but yet it appears that they will eventu-

Fig. 4.—A steel cylinder with a cast iron head. The inlet valve is by the side of the cylinder, and the exhaust valve with a detachable seating above the inlet.

ally prove highly satisfactory. The inlet valve seating in the aluminium is successful, and the exhaust valve cage, with its seating integral, will, of course, remain of cast iron.

The experiments that have been referred to include cylinders up to 92 mm. bore, but an engine of 110 mm. bore is being erected, fitted with cylinders of this design.

**Cylinder Attachment.**

A common method of attaching the cylinders to the crank case on an air-cooled engine is by means of long bolts running from the crank case to the

Fig. 5.—A piston for air-cooled engines. Ribs are provided to convey the heat from the head to the piston rings and thence to the cylinder walls. The gudgeon pin bosses are kept well down and well away from the cooling ribs.

cylinder head. This is not good practice on account of the expansion of the cylinder when hot very highly stressing the bolts. The bolts themselves do not expand appreciably because they are comparatively cool, being some distance away from the cylinder, and in one engine the writer has come into contact with it is very usual to see blue flames spitting out of the joint between the cylinder and the cylinder head when starting up from cold. After a little while the flames cease, as the joint is made good by expansion, but, if the bolts are tightened down in the first place, they invariably break.

**Other Factors.**

The subject of direct air cooling is, of course, inexhaustible, and the writer has only touched on a few of the more important points. Of the numerous other details connected with satisfactory air cooling, which through lack of space the writer has not been able to refer to, are (1) valve setting, particularly the early or late opening of the exhaust valve; (2) compression ratio and its effect on fuel consumption; (3) shape of combustion chamber; (4) bore-stroke ratio.

As already implied, the writer is of the opinion that air cooling can be accomplished with as much satisfaction as in the case of water circulation cooling, at any rate up to 30 h.p. in touring cars, and at least 200 h.p. in aeronautical engines.

# THE STURMEY-ARCHER LIGHTWEIGHT GEAR.

A Two-speed Countershaft Dog Clutch Gear Box obtainable with or without a Friction Clutch. Foot Control Adopted.

SOME weeks ago we announced the advent of a SturmeY-Archer two-speed lightweight gear.

The three-speed gear box produced by SturmeY-Archer Gears, Ltd., is now such a well-known and appreciated fitting on medium weight machines that it is not surprising that the company has decided to devote its attention to the production of a gear for the growingly popular lightweight.

Last week we saw the first of these new gears, and had the pleasure of trying it fitted to a two-stroke Sun-V.T.S. lightweight. The new gear is a most compact little unit, scaling but 13 lb. complete, and naturally the benefit of the SturmeY-Archer Co.'s experience in the manufacture of gears has been utilised

to the full. The most practical point about the gear is the one-piece aluminium casing. Every rider knows the nuisance of a leaky gear box, and a box devoid of joints is likely to remain as clean as a gear box could well be. The new gear is of the usual dog clutch type, and provides two speeds giving a double reduction.

## A Thermoid Plate Clutch.

The gear may be obtained with or without a clutch, as desired, the clutch

when fitted being mounted within the chain wheel. The plates are of Thermoid—which is found superior to cork insets—and permit of any amount of slipping, as we proved by trial. The machine we rode had just returned from a gruelling test over roads deeps in snow and slush in the hands of the designer, Mr. J. Cohen.

The mainshaft of the gear is mounted on a couple of British Skefko bearings, whilst the layshaft is of hardened steel running over a plain hardened and ground steel pin suitably grooved to provide the

The new SturmeY-Archer two-speed countershaft gear fitted to a Sun-V.T.S. machine.

necessary lubrication. Advantage is taken of the opportunity of fitting a large driving pulley, so that the ideal of pulleys of equal size is brought nearer.

## The Method of Changing.

The control of the gear is by a pedal and trigger arrangement, though the method adopted on the fore-runner of the type is to be slightly amended in future specimens. At the present time there is a medium-sized pedal with a tiny trigger engaging in a ratchet. Pressing the main pedal engages the low gear, and on releasing the trigger the top gear is obtained. A similar arrangement, but much more substantial in its construction and positive in its working, is to be standardised. We were glad to note the adoption of foot control, as any method which does not necessitate releasing the handle-bars is to be preferred, particularly on slippery roads.

The gear is suspended from the bottom bracket in the usual manner by two stout studs passing through a plate clamped to the chain stays. A kick-starter is not favoured by the SturmeY-Archer designer for the lightweight gear; indeed, we were told that rather than put up with the added weight of the kick-starter mechanism a third speed would be preferred, in which view we heartily concur.

Sectional views of the new SturmeY-Archer two-speed lightweight gear.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

## Record Number of Recruits for the Motor Machine Gun Service Last Week; over 200 Motor Cyclists Accepted.

THE anticipations of a record number of recruits for the M.M.G.S. last week were realised. On Tuesday over 150 men attended the Coventry Recruiting Office for examination, and of these 120 passed the test. The last man was not examined until after 8 p.m. Further batches of candidates were inspected in Nottingham on Wednesday and London on Saturday last.

In the latest list of recruits are included the names of Edgar Willis (who has two brothers already serving in the M.M.G.S., viz., Sgt.-Maj. G. Willis and Sgt. Willis), L. R. Pipe, organist and music master to the Duke of Newcastle, and Councillor A. C. Bannington, of Coventry, who was a member of the local Appeal Tribunal. Councillor Bannington owns a Triumph sidecar outfit, and is a builder by trade.

A large number of Colonials have attended the inspections of the M.M.G.S. from time to time, and are now serving in this branch of the Service. The latest addition to the ranks is W. M. S. Taylor, of Cambuslang, who paid his own expenses from Nyassaland specially to join the Colours.

An inspection of recruits was arranged for Tuesday afternoon this week, and there will be a further inspection on Tuesday afternoon next, the 4th prox., at the Coventry Recruiting Office, Masonic Buildings, 11 a.m. to 5 p.m.

Provided there are sufficient applications from the London district and South of England to warrant it, the Editor, Mr. Geoffrey Smith, will attend at *The Motor Cycle* offices, 20, Tudor Street, London, E.C.; on Saturday afternoon, the 8th April. A definite announcement on this point will be made in the next issue of this journal, when more is known of the number of vacancies still existing.

All recruits for the M.M.G.S. pass through the Editor's hands, and in applying men living at a distance should enclose two references. Motor cyclists and a limited number of car drivers are wanted. Application should be made in the first instance on the usual printed form (see last week's issue, page 279).

*The Motor Cycle* in a dug-out. The latter is well equipped, being fitted with a fireplace, mantelshelf, and acetylene gas lighting. All cooking is done by means of Primus stoves, two of which can be seen on the mantelshelf. We have to thank Pte. E. M. Oliver, formerly a prominent member of the Purley and District M.C.C., who is reading the paper, for the photograph.

A list of recruits passed by Mr. G. Smith last week in Coventry, Nottingham, and London is appended:

# WAR TIME ACTIVITIES OF THE A.C.U.

As Revealed by a Perusal of the Thirteenth Annual Report.

THE Auto Cycle Union has, as is well known, done yeoman service to the country in acting first of all as the office of the London District Motor Cycle Reserve Committee, the whole of the work of which was done by the A.C.U. staff, and up to December last 6,400 applications for enlistment were dealt with. In January last the secretary was placed in charge of the Central Office Motor Cyclists' Reserve Committee, R.E., with its headquarters at the offices of the A.C.U. No fewer than 1,160 men called for advice at the Central Office during the first six weeks of its existence.

The A.C.U. has also been of assistance to other Government departments in connection with matters arising out of the war, and is represented on the

Central Committee for Employment of Discharged Soldiers and Sailors connected with the motor industry. It is hoped that, through this Association, no motor cyclist who has served his country ashore or afloat during the present war may lack employment when peace is declared.

With regard to membership, early in the war the committee agreed that any member who by reason of his being away on Service could not conveniently remit his subscription should be made an honorary member. Over a thousand members have availed themselves of this offer. One thousand eight hundred and seventy-nine new members joined during the year. In accordance with the policy of making all possible concessions during these difficult times, the committee re-

vised the rules as regards membership, and from July 1st, 1915, any new member joining the Union is entitled to twelve months' benefits for the one subscription whenever paid. It was further agreed that members availing themselves of the full recommended insurance policy be admitted to touring membership without payment of the annual subscription, whilst the radius from London, outside which full members are entitled to the reduced "country" rate of subscription, has been reduced from thirty to twenty miles.

Advice was given to numerous members as regards routes and journeys during 1915. The Legal Department has had plenty of work to do, though less than in times of peace, while the Insurance Department has been particularly active.

## PROHIBITION OF MOTOR CYCLE IMPORTS.

What the Importers Think.

WE have lately taken the opportunity of getting the views of some of the leading firms who deal in American motor cycles in this country concerning the recent prohibition of the import of foreign machines. Mr. Duncan Watson, the managing director of the Harley-Davidson Motor Co., pointed out that his firm re-exported motor cycles to every country except the United States, consequently the loss of the home market would not be a very serious matter to them. His firm was in such a position that all contracts entered into by them and sealed by the Board would be met. The only difficulty would be in the way of obtaining new business. Nevertheless, these contracts covered the ground pretty fully, and so they did not anticipate any great trouble. They have been, and are, specialising for this season on sidecarriers, of which they have had a number on trial, and these have proved themselves to be eminently satisfactory, and quite capable of meeting the regular demands of tradesmen who resort to this up-to-date method of delivering their goods.

The agents for American motor bicycles over here are naturally hard hit over the recent Order in Council forbidding any further imports of machines. Fortunately, most of them

A B.S.A. IN FRANCE.

A T.T. B.S.A. used by M. C. Dietz, attached to a French A.S.C. Supply Column, which has been used since the beginning of the campaign on the worst roads on the Belgian front. M. Dietz fitted the engine with a very neat valve cover.

have a very fair stock and plenty of spare parts, so that there will be still for some time a limited number of machines for sale. It may not be generally realised that the Order in Council prohibits the import of spare parts and accessories as well as complete motor cycles. This would, of course, press somewhat hardly upon riders of American machines except for the fact that agents hold large stocks of spares. A few of the firms will endeavour to import sidecarriers. These facts have been gathered after visiting the Reading Standard Motor Cycle Co., Messrs. Harris and Co. (Excelsior), the Hendee Manufacturing Co. (Indian), and the Pope Motor Cycle Agency.

Exemption from Duty for Tourists.

Last Friday's *Gazette* contained the announcement that the Treasury will, at the expiration of forty days, make regulations providing for the total or partial exemption for a limited period from the new import duty of any cars and motor cycles brought into Great Britain or Ireland by persons making only a temporary stay therein.

## NEWS FROM AUSTRALIA.

THE Canberra Motor Cycle Club of New South Wales held a 100 miles road race at Hartley on January 26th. The course was a circular one of three and three-quarter miles to the lap, and the event was based on a handicap. The first three places were secured as follow:

1. B. Wickham (8 h.p. American Excelsior)
  2. F. J. Berry (2½ h.p. Douglas).
  3. G. Pellet (3½ h.p. Douglas).
- The winner, we are informed, had 2m. start of Millar (Douglas), who was doing remarkably well until put out of the running by punctures.

The entry fees were paid over to the

St. John Ambulance Wounded Soldiers' Fund, Randwick Division.

The 24 Hours Record.

The latest copy to hand of *The Australian Motorist* provides an amount of interesting information concerning Erwin Baker's long distance road record, cabled reports of which appeared in *The Motor Cycle* of February 10th and 24th. Erwin Baker is an American rider of a Powerplus Indian, and during a visit to Australia he has put up many records, the most important of which is the twenty-four hours.

For the latter he used a circular course of 33.9 miles, known as the Mortlake

circuit, and situated in Western Victoria. It is perhaps the most suitable road for such a purpose in the Commonwealth, and is often used by the Victorian M.C.C. of Melbourne.

Baker had not the best of fortune, and he had three shots at the record, in the last of which he covered 1,027 miles in 21½ hours. At this distance a fracture of the oil tank occurred and the ride came to an end, but not before the object aimed at had been successfully secured. The average speed, including all stops, is 48.2 m.p.h. It was a magnificent ride, and Erwin Baker has returned to the United States very pleased with the results of his visit.

## MILITARY NOTES.

## MOTOR CYCLISTS IN THE R.F.C.

IN the early days of the war motor cyclists distinguished themselves, as was natural, chiefly in the signal section of the Royal Engineers, and still continue to do valuable work, though not quite so thrilling, unless there is a "move." In this branch of the service, as in others, they excel as motor cyclists.

As we have often pointed out, motor cycle riding teaches a man self-reliance and quickness of intellect, brought about by a perfect understanding between man and machine; it gives him a sure eye and braces his nerves, and so renders him suitable for a multitude of duties. Naturally, these qualifications are eminently suitable for work in the popular R.F.C. So many of our leading naval and military pilots were and are skilled motor cyclists. T. Sopwith was one in his early youth; Victor Wilberforce, R.N., another; A. V. Roe; Graham Price, whose death we reported in our last issue; M. A. J. Orde, concerning whom there is, alas! no further news, though it is hoped that he has made a landing somewhere in enemy territory. Then there is Capt. A. M. Low, whose work in the technical branch of the R.F.C. recently earned him promotion in less than a year from Sec.-Lt. to Capt.; O. C. Godfrey, who has just been gazetted to a commission; and R. L. Keller. Keller, a member of the P.S.M.C.C., has seen much fighting. He was granted a commission early in the war in the Warwickshire Regiment, was wounded in July last, and has now been transferred to the R.F.C.

## DESPATCH RIDING WORK IN MIDDLESEX.

AFTER the many items of news concerning the work of despatch riders in the different war zones that have appeared from time to time in *The Motor Cycle*, it is quite home-like to hear from a man who, with a couple of comrades, does work of this description in London and district.

Ptes. Coldham, Chisholm, and Pawsey are attached to a Mechanical Transport depot located near Sunbury-on-Thames, and two journeys to town have to be made daily, irrespective of numerous other runs. Most of their work lies in

the Metropolitan area, and whereas despatch riders in France spend part of their time avoiding shell holes, these men spend part of their time when on duty in avoiding, so far as possible, police traps. There is a good deal of night and heavy traffic riding, so that the work is not so easy as it might appear at first sight. Also, the very bad condition of the roads locally, due to the heavy lorry traffic, makes it a severe test for both riders and machines.

## SUPER-KEENNESS OF COLONIALS.

THE keenness of the average Colonial to do "his bit" has been one of the outstanding features of the war. A typical instance is that of D. Leslie, of Port Elizabeth, who at the end of last year wrote to the editor of *The Motor Cycle* for particulars of enlistment in the M.M.G.S. and R.E. despatch riders. The necessary

## DESPATCH RIDERS ATTACHED TO AN A.S.C., M.T. COLUMN

From left to right: Ptes. Coldham (2½ h.p. Douglas), Chisholm (4 h.p. Triumph), and Pawsey (2½ h.p. Douglas). Since the photograph was taken the two 2½ h.p. Douglases have been replaced by a 3½ h.p. Rudge Multi and a 4 h.p. two-speed Douglas.

## STATIONED ON EAST COAST.

IT is not often we give pictures of despatch riders on service in England for the simple reason that the great majority of men enlisted as despatch riders are for service abroad. The eleven riders shown in the large illustration on this page have been engaged on military duty at home for some time, but they are all keen to go abroad. All the machines, we are informed, have stood up exceedingly well, despite the far from ideal conditions prevailing on the East Coast.

particulars were sent immediately, but Leslie, who disliked the slightest delay, enlisted meanwhile as a despatch rider for the German East African campaign, and the last we heard of him was in a letter dated February 27th, when he was en route for German East Africa with fifty other motor cyclists. When General Smuts's campaign is over, and if the European campaign is not finished, Leslie intends renewing his application for enlistment here either in the M.M.G.S. or the R.E.

## A SECTION OF R.E. DESPATCH RIDERS STATIONED ON THE EAST COAST OF ENGLAND.

From left to right—L.-Cpls. G. L. Fawdon (Indian), J. Warden (Triumph), R. R. Watson (Douglas), E. M. S. Davison (Douglas), R. E. Simpson (Triumph), Lt. G. W. Turnbull (Triumph), L.-Cpls. G. W. Urwin, R. W. Robinson, T. E. Raw, R. Butler, and Cpl. Glaholm on Triumphs.

### TIMES TO LIGHT LAMPS. (GREENWICH TIME).

Mar. 30	...	...	6.57 p.m.
April 1	...	...	7.0 "
" 3	...	...	7.3 "
" 5	...	...	7.6 "

### A Fortnight Hence.

Thursday, April 13th, is the date of the annual spring number of *The Motor Cycle*.

### Time Squared.

Next month a contemporary announces that it will hold a public schools' championship. The formula mentioned is that of *The Motor Cycle*—the figures, though disguised, will give the same result.

### The National War Funds.

At the week-end the principal relief funds stood as follows:

The Prince of Wales's National Relief Fund (£3,073,000 distributed) .. .. .	£5,836,093	0	0
Fund for the Sick and Wounded .. .. .	3,567,085	0	0
Tobacco Fund .. .. .	102,557	0	0
The Queen's Work for Women Fund .. .. .	168,731	5	10

### PREPARED FOR ANY WEATHER!

Mrs. F. C. Skidmore, of Ealing, who has quite recently taken to motor cycling, and who thoroughly enjoys driving her husband's A.B.C. sidecar. The becoming, and at the same time completely storm-resisting, outfit worn by Mrs. Skidmore will meet with the approval of our lady readers.

### A Californian Trial.

There were forty-two starters in a trial for motor cyclists from San Francisco to San José held last month. Thirty-seven riders completed the course, and twenty-seven of these (including the Harley-Davidson sidecar team) came through with perfect scores.

### Lantern Slides with the Grand Fleet.

*The Motor Cycle* series of lantern slides, which have been with the Grand Fleet for some months past, have now passed from one to the other of the ships of the First Cruiser Squadron, and a letter from Rear-Admiral Sir Robert K. Arbuthnot, Bart., mentions how much the slides have been appreciated by officers and men.

### Liverpool Motor Volunteers.

A new squadron of the National Motor Volunteers, Port of Liverpool Centre, is in course of formation, and the following vehicles (and drivers thereof) are required: Twenty-four motor waggons, eight cars, and twelve motor cycles. Car drivers and motor cyclists in the Liverpool district who are prepared to join should write to Mr. J. Graham Reece, 22, Rodney Street, Liverpool. The following are eligible: Men not of military age, men who have been medically refused, or those attested and not yet called up.

### So-called Pleasure Motoring.

The General Committee of the Royal Automobile and Associated Clubs representing all car and motor cycle organisations in the country, has addressed to the National Organising Committee for War Savings, the Ministry of Munitions, and the War Office a protest against the manner in which the appeal of the first-named, relating to the use of cars and motor cycles for pleasure, was framed.

Generous extracts from the letter appeared in the daily press last week, so it is only necessary to add that the points brought forward by the committee of the Royal Automobile and Associated Clubs agree with the sentiments on the same subject that have been expressed in recent numbers of *The Motor Cycle*.

### FOUR DESPATCH RIDERS WHO SERBIAN OPERATIONS

The photograph was taken last month  
A. S. Ashmore, A. P.

### Fat Sparks of Optimism.

Dan R. Walls is the name of the publicity manager of the Splitdorf Electrical Co. makers of the American Dixie magnetos. According to an American contemporary he is known among his friends as "Dixie Dan," because he radiates fat sparks of optimism.

### Advice Wanted.

A South African correspondent asks our readers to recommend him a carburettor which will give satisfactory results on a 7 h.p. Matchless (1914). We should say that all well-known carburettors would give good results, though some are better in or respect, others in another, and our correspondent does not say in what manner the original carburettor failed to come up to his ideas.

### Exports of American Motor Cycles.

Figures issued by the U.S. Department of Commerce relating to exports from the United States of motor cycles in 1915, 1914 and 1913 show clearly the trade obtained by the Americans due to British motor cycle manufacturers being engaged on munition.

The numbers exported are:		
1915	...	14,836
1914	...	6,556
1913	...	4,131

### Hoarding Petrol.

Evidence that unpatriotic people are "grabbing" petrol was given in two police cases, instituted under the Defence of the Realm Act, at the Jersey Royal Court on Saturday last. A Government contractor was fined the maximum penalty of £100 for illegal storage of petrol at stables in St. Helier and £50 for a similar offence at farm. An order was made for the confiscation of 464 gallons of petrol.

The second case was that of an agent fined £100 for allowing petrol to be carted to uncertified stores.

### Unusual Collision leads to Legal Proceedings.

A somewhat unusual type of accident led to a law case at Edinburgh last week, where two variety artistes, who travel from theatre to theatre by motor cycle, sued the driver of a car for damage. Plaintiffs were sheltering under a bridge during a thunderstorm with their machines on the side walk. It was stated that defendant, driving his car at a dangerous speed, mounted the side walk and ran into one of the plaintiffs and the two motor cycles. Defendant maintained that he was travelling at a safe speed, and that the machines were so placed as to make

PART IN THE WHOLE OF THE LATTER END OF 1915.

From left to right: P. Collins, and T. G. Quinney.

A trap for a south-going car. The jury found for plaintiffs, and awarded £85 for personal injuries and damage to machines.

#### Sidelight on So-called Pleasure Motoring.

An instructive sidelight is thrown on the question as to who are at present the chief road users by the applications for A.A. membership. Sixty per cent. of such new members are military and naval users of cars and motor cycles. At the same time, any special work the Association is called upon to do for private motorists using their cars for rival purposes is negligible.

#### Tuesday's Gale.

Those motor cyclists who use their machines or getting to and from business daily must have had a rough time in the blizzard on Tuesday morning this week. Riding, even when possible, was most dangerous on account of fallen trees and telegraph posts across the road. Sidecarriers regularly ply between Valsall, Wolverhampton, Birmingham, and Coventry in the interests of manufacturers in the district, but Tuesday's gale put a stop to all forms of traffic for a time. In more than one section a whole series of telegraph poles had been blown down and lay across the road—an effectual barrier. One of our staff, who wisely left his motor cycle at home, climbed six fallen trees in a distance of about a quarter of a mile, or a little more.

#### With the British Red Cross in Italy.

We have received an interesting communication from a motor cyclist attached to the British Red Cross Society in the Carnic Alps. He is anxious to try one or two motor cycles fitted with sidecar ambulances, which he thinks would be cheaper to run, and would be able to reach places impossible for cars. The roads are narrow and very bad, with long, but not very steep, gradients. He wisely thinks a 6 h.p. chain-driven twin with three-speed countershaft gear would be the most suitable mount. He is at present using one of the latest pattern triumphs, which he uses to go to the various utility stations, some of which are situated high up in the mountains. His duties consist of taking the mails, small parcels, and small parcels, and, at the same time, collecting reports. The machine, he says, is the envy of the Italian riders, and has behaved magnificently, although the riding conditions are most difficult, as at times he has to cross streams by wading, pushing the machine. Some of the roads, he tells us, are just like a bed of a river, consisting as they do of rolled stones.

#### Proposed Johannesburg Training Association.

The committee of the Pretoria Motor Club has had under consideration for some time the formation of a military training association for those members not on active service. The recent heavy recruiting for the German East African campaign has hindered matters, but by now, we gather from the hon. secretary, Mr. D. Hyams, matters may have taken more definite shape.

#### Melbourne to Sydney Record.

According to cablegrams published in the daily press at the beginning of this week, a Mr. Edkins has motored from Melbourne to Sydney, a distance of about 580 miles, in 16h. 45m. This gives an average of just over thirty-four miles an hour, a remarkable speed for such a distance and such a road. It will be interesting to have details and to see whether the run was made by motor cycle or car.

#### Street Accidents in 1915.

No fewer than sixty-three deaths caused by street accidents were investigated by Dr. Waldo, His Majesty's coroner for the City of London and Southwark, during 1915. This constitutes a record, and is seventeen in excess of the number registered during the previous year. Many suggestions have been made by juries with a view to lessening the loss of life, among which are the following:

That during lighting-up time a regulation be made and enforced, restricting the speed of vehicles to a maximum of 10 m.p.h.

That the construction of the front part of steam lorries should be altered in such a manner that the driver may be able to see and direct his course with greater precision than at present and so avoid the danger of collision with other users of the road.

It is pointed out that a large percentage of the fatalities are due to the careless disregard of pedestrians for their own safety.

#### SPECIAL FEATURES.

WEATHERPROOF HUBS (Illustrated).

SIDECARRING FOR AN INVALID.

NEW STURMEY-ARCHER LIGHTWEIGHT GEAR.

#### What of the Budget?

How will the import prohibition affect second-hand prices? In view of the fact that comparatively few motor cycles are now being produced by home manufacturers, it is extremely likely that the prices will be enhanced, but then, what of the Budget?

#### Why Single Out Motorists?

"Don't use a motor car for pleasure" runs a huge poster in the Admiralty archway in Whitehall. We suggest that the R.A.C. or A.C.U. erect a similar one in Pall Mall, "Don't go to the theatre for pleasure." Just why there is this dead set against motorists on unproved evidence it is difficult to say.

#### Something to Think About.

If the taxes on motor vehicles are doubled, will the Government take into consideration the value and comparatively low power (with a consequent minimum of road wear) of old pattern motor cycles and cars? If not, some vehicles will have a value very little in excess of the yearly tax.

#### TESTING UNDER DIFFICULTIES.

War Office Clynos under test during a recent snowstorm. From left to right, the riders are E. Walton, W. S. Life, J. Bowyer, J. Riley, and F. Jenkins.

# NOVEL HOME-MADE CYCLE CAR.

A Simple Two-seater with  $3\frac{1}{2}$  h.p. Douglas Engine and Gear Box.

A three-wheeler built by Mr. Elverstone in his spare time. The power unit is a  $3\frac{1}{2}$  h.p. Douglas motor cycle engine.

THE rather novel and ingenious tricar illustrated has been made by Mr. Elverstone, who is an enthusiastic Manchester amateur. The chassis is tubular and is supported in front on semi-elliptic springs, while the rear wheel is unsprung. The engine and gear box are those taken from the owner's  $3\frac{1}{2}$  h.p. Douglas, which are placed lengthways in the front of the chassis. They are equally balanced over the front axle, where they are securely attached to a wooden platform.

## Engine Started from Driver's Seat.

The drive is taken direct from the gear box, which is situated directly behind the engine, to the rear wheel by a rather long belt drive. A dummy wire radiator is placed in front, while the petrol is carried in a cylindrical tank above the engine.

By an ingenious extension of the kick-starter pedal the engine can be started from the driver's seat. Brakes are fitted to all three wheels, the front being the original hand brake of the motor cycle and the

rear one acting on the belt rim in the usual manner. All brakes are, however, operated by the feet. The wheel steering is connected up direct without any gearing down.

Quite a roomy two-seated body is fitted, the back being extended in a streamline shape well over the rear wheel; this back should prove a most efficient mudguard. The owner tells us that he finds the outfit more comfortable than a sidecar outfit, while there is no appreciable difference in the petrol consumption between the two types.

## LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### How Many Motor Cycles?

Sir,—I have collected 200 names of different makes of motor cycles. Can you tell me how many there are altogether? My favourite day in the week is Thursday, when I get *The Motor Cycle*. I used to get a comic paper, now I buy *The Motor Cycle* with my penny. My father has a Quadrant. When I am fourteen I shall have either a T.T. Zenith, or a T.T. Rudge-Multi, or a T.T. Douglas.

JACK WATERHOUSE (Age 7).

[There are about 300 models of motor cycles on the market, but these include the several models made by each manufacturer. If our correspondent has a list of 200 different makes he cannot have missed many. We congratulate him.—Ed.]

#### Paraffin as a Fuel.

Sir,—Since August, 1915, I have run on equal parts of petrol and paraffin with my 2½ h.p. twin Enfield. No alteration was made to the carburetter, for the machine started readily and developed full power.

I average 150 miles per week, and have taken the engine down but once. Little carbon deposit was found, and the engine still runs smoothly and quietly. I am quite satisfied with the mixture. S. E. G. HILL.

Sir,—I have for the last two months been using a mixture of this myself. I have tried several different mixtures, but have found that without altering the carburetter I obtained the best results from half a gallon of petrol (No. 2) and half a gallon of paraffin. I am very satisfied with the result. So far I have had no trouble in starting or running slowly or knocking, and on a long run I have procured 112 m.p.g. on the above mixture. My machine is a 1913 2½ h.p. Douglas two-speed gear. J. LEY.

Sir,—Having read in *The Motor Cycle* the interesting experiences of D. R. Edwardes-Ker, "Paraffin as a Fuel," I take the liberty of making a few remarks myself, as I am the patentee of a device, "To facilitate the use of paraffin," which was illustrated in *The Motor Cycle* on February 18th, 1915.

Your correspondent says paraffin can be used in an ordinary petrol carburetter. Quite true. He then says when paraffin alone is used considerable knocking is obtained on the slightest provocation on hills with overheating.

Now, the reason I write is to explain the cause and remedy of knocking. Knocking is caused by too much compression. Assuming now we have a motor cycle with a clean cylinder which does not knock or overheat. We run this engine on petrol, and the combustion head becomes carbonised. This deposit gradually accumulates and increases the compression ratio until the engine will knock, overheat, and suffer from pre-ignition. We then decarbonise, and the engine runs without knocking once again. Now, assuming that instead of decarbonising the cylinder, to stop the knocking by reducing the compression ratio, we reduce the compression by fitting an auxiliary compression chamber which can be screwed into the cylinder in the place of a valve cap, the engine will then run without knocking or overheating.

Referring to paraffin again, should an engine knock when using paraffin, it is necessary to reduce the compression sufficiently by screwing an auxiliary compression chamber into the cylinder in place of a valve cap; then the engine can be run on pure paraffin, and will run as well on this cheaper fuel as on the expensive petrol. It must be understood that different fuels require different compression ratios.

The use of paraffin does not deteriorate any part of the engine, and considerable economy is effected. I have thoroughly tested paraffin as a fuel, and must say that very little difference in the running is noticeable. Of course, my machine is fitted with my patent improved fuel feed system. I have no doubt that paraffin will be the fuel employed in the future, and when a paraffin driven motor cycle comes on the market, as it will eventually, there will be a big demand for it. E.S.

Sir,—I feel I cannot allow your correspondent's letter re paraffin as a fuel to pass unheeded. I refer to that of Mr. T. H. Ward in a recent issue. Paraffin will give more power, increased flexibility, and will not overheat or ruin valves and bearings if treated in a manner it deserves. To run paraffin through an ordinary carburetter is asking for trouble; but with a properly designed instrument, such as was fitted by a friend and myself to a 3½ h.p. Triumph over three years ago, I can guarantee any of the advantages mentioned above.

As is well known, paraffin induced through an ordinary carburetter is induced in the form of small particles and not as a vapour. As I can prove from experience, the paraffin in this form will leak from valve caps and will wash away the oil from the cylinder walls. Obviously this shows incorrect carburation, and is detrimental to the well-being of the engine. With the carburetter we fitted, it was possible to start up with a liberal injection of petrol, and it would give more power on hills, more miles to the gallon, and more speed without overheating or knocking. It was possible to get well over 150 m.p.g. with close on 60 m.p.h. I think this will show that with paraffin, if correctly treated, one can get much better results than with petrol. The only disadvantage was the "creeping" of the paraffin all over the machine. As for the difference in price of petrol and paraffin, I fancy that can be left to your readers.

I might mention that carbon deposit was light and soft in nature. The absence of knocking was due to two causes: Firstly, the softer impulse on the explosion stroke owing to the paraffin being slower in burning than petrol; and secondly, that there was no unvaporised fuel to wash away the oil from the cylinder walls.

I hope you can find room for this in your valuable paper. I think it is quite time paraffin was treated with a little more respect and not contempt. FE 535.

#### Stars and Stripes.

Sir,—Can I sit in on a few of the Ford stories you are listening to? Thanks!

There was talk that Ford was going to paint his cars yellow in 1916 and sell them in bunches the same as bananas, but nothing came of it.

That will be enough, seeing that you are receiving so many from other readers.

We have had an unusually hard winter this season, just one snowstorm after another.

Have ridden three American lightweights to date, and think the Indian featherweight to be the best of the lot. That one has three speeds, a clutch and a kick starter, and, much more important, a get-away that is astonishing for a two-stroker. By golly! if the local agent does not look out I shall be wearing out his demonstrator for him.

Just for a trial the other day, O'Brien, of the Hendee Manufacturing Co., took me on the luggage carrier, and went out in a snowstorm. We bucked four inches of the beautiful white stuff for six miles, and the engine just purred along all the time, and we weighed 340 lb. at that.

There was a time when I thought the carburettor controls on the handle-bars were unsightly; possibly I do still, but that is forgotten in my enthusiasm over the Amac and B. and B. carburetters.

Some day, and it is not far distant, our riders are going to fall hard for the twin two-stroke, for that, to my mind, would be ideal; just like a Henderson four-cylinder without the weight or cost.

Well, I have to save some stuff for another letter, hence the period goes right here.

ELLIOTT B. HOLTON,

Secretary, New Jersey Motor Cycle Club.

Newark, N.J., U.S.A.

### Baby Two-strokes up Freak Hills.

Sir,—As two-stroke experiences are of general interest now, and in response to the request for these, I have taken my Triumph Junior up Sutton-Bank, Kirkstone Pass, Garrowby Hill, Greenhow Bank, Dunmail Raise, Blue Bank, and Saltersgate Hill (Devil's Elbow), etc., in the course of a good bit of touring. I bought it to hack about up to golf, etc., and did not realise its possibilities. For touring it is not fast, but will average 20, besides being very comfortable, with an even torque, and it does not mind grease or bad surface. Tyres and belts seem to last indefinitely, but the consumption for a 2½ h.p. is high (about 70 m.p.g.), and so is the oil. The petrol system is dirty, and the carburettor has often to come down; in fact, this is a real drawback, but I hear there is an improvement on the way. The engine soon loses power unless kept clean, and I take it down about each 500 miles, but this is a simple job. The machine is a real bit of Triumph work in construction, and in this respect succeeds where many similar machines fail, as the latter are not strong enough for the engine. I have driven different motor bicycles and cars since 1907 and have some experience, and my conclusions are that, within its limitations, the Triumph Junior is a lovable jigger, suitable for lady or an ancient like myself. MALCOLM O. JONES.

### Diesel Engines for Motor Cycles.

Sir,—I would like very briefly to comment on two letters from correspondents in *The Motor Cycle*.

I am particularly interested in the letter from Capt. M. Vacy-Ash, and I fully agree with him that the time is bound to come when an engine will not have the varying mixtures thrown at it anyhow, but will be fed with the proper amount for both conditions of stroke and speed.

Unfortunately, if the petrol is diluted with heavy fuels of the paraffin family, sufficient to obtain economy, the small valves are very liable to stick; but I think this is a point which could be overcome particularly by means of water injection or the use of lower compression engines or alcohol.

The letter from Mr. A. B. K. Watkins is, if I may say so, also very interesting, particularly to me, as I have conducted many experiments with the use of petrol vapour and water for turbine purposes. To use water in the cylinder in large quantities, except for cooling by direct injection, and particularly if the cylinder is lagged, might not only mean that the temperature would be rather high, unless a separate plate were used, such as for solid fuels, etc., but if the walls were kept hot enough efficiently to prepare the steam it might mean that they would be too hot for effective running on mixture, and too hot to lubricate effectively.

The dangerous deposit obtained with paraffin is very common unless the compression is lowered. It is simply a tarry carbon which collects in the rings and piston, etc.

It is dangerous because of its extraordinarily scaley and hard nature, which is very liable to cause sticking and scoring of the cylinder.

A. M. LOW, A.C.G.I., D.Sc., etc.

### Carbonisation.

Sir,—The following experiences, based on seventeen years' riding, may be of interest as being diametrically opposed to those of Mr. Olsson, whose figures strike me as hardly credible.

Since 1910 I have owned and driven the following machines, all of the single-gear fixed engine type. Most were used at least 5,000 miles, each was driven at fairly easy speeds, and all were kept in tip-top order. All gave the greatest possible satisfaction. Careful records were

kept of each run and adjustment, made. All the well-known carburetters were fitted, but no difference was discernible in this respect (except possibly in favour of the variable jet type). All were new machines, and most had picked engines.

The machines were two T.T. Triumphs, one 8 h.p. 85×85 twin Matchless-Jap, one T.T. Bradbury, one T.T. Rover, one 90×77½ single J.A.P., and two T.T. Jameses (86×96 and 86×103). The last-mentioned machine was made to my special order, and is not standard. All were run with fairly high gears—4 to 4½ in the case of the singles and 3½ to 3½ to 1 in the case of the "twicer." Huile de Luxe used in all.

In the case of the singles it has invariably been found that poor running and "konking" started after, about five hundred miles since the last decarbonising, and in *not one* instance was it found possible to put off the evil day beyond seven hundred miles. In fact, had I been a competition rider the cleaning would have been effected every three hundred to four hundred. The twin would run eight hundred to nine hundred miles without deteriorating, but was unquestionably under-oiled.

None of the machines were over-oiled, and one pumpful every sixteen miles has been found ample with the 3½'s at touring speeds.

"Blinding" has not been indulged in, and the driving has, I think, been reasonably skilful all through, which makes the matter all the more mysterious. On the other hand, a large part of the mileage is covered by London traffic, and my personal view is that the carbonising is due to running on nearly shut throttle at slow speeds with big engines. Further, the gears being high would demand a very high level of tune in the engine.

Accordingly I should be most interested to hear other riders' experiences, as I regard this point of vital importance to keen riders. In fact, so important is it that my choice of a machine depends to a large degree upon the ease or otherwise of detaching the cylinders. Hence twins have been avoided, as usually being heavy sinners in this respect; makers are extremely remiss in this connection.

I should like to know of the oil that costs 7s. 6d. per gallon.

AUTOBORE.

### 45,393 Miles in Three Years on a Triumph.

Sir,—Motor cyclists seldom retain their machines for more than one or two seasons. The following extracts from my records may therefore be of interest to your readers.

The machine, originally a three-speed 1913 Triumph, has been on the road practically every day for three years, though recently, owing to my having the use of a Government car, the weekly mileage run has been very much reduced.

The early pattern three-speed gear fitted to the machine has now been scrapped, a Triumph free engine being substituted. A free-engined Triumph is, in my opinion, an ideal solo mount.

The expenditure on tyres has been heavy. For two and a half years I stuck to one make of rubber-studded tyres. Originally I got well over 4,000 miles from a back tyre and at least 6,000 miles from a front, but this mileage steadily went down until my last three back tyres all gave way at the bead in less than 2,000 miles.

On August 1st last I fitted a pair of Dunlops, and am still running the same pair. They are splendid non-skids and have run all through the winter without giving me any trouble.

The machine commences its fourth season in excellent order, and it is a curious fact that with old age it becomes more and more reliable.

Expenses come out as follow:

Licences, etc. ... ..	£3 10 0
Refits, etc. ... ..	38 16 1
Fuel ... ..	35 0 6
Oil ... ..	4 7 4
Tyres ... ..	31 4 3
Belts ... ..	7 5 3
Carbide ... ..	13 6
Depreciation ... ..	40 0 0

£161 7 11

.85d. per mile.

C. W. TOMLINSON, Lt.-Com. R.N.

### Top Feed Carburetters.

Sir,—Under the heading of "Occasional Comments" in your issue of March 9th I found a paragraph which I read with much interest.

My machine, a 4 h.p. chain-driven B.S.A., is fitted with a "top-feed" carburetter, and has rendered continuous service throughout the war without the very slightest trouble.

In the first place, vibration flooding is a thing I am never troubled with. The filter keeps remarkably clean, the dirt simply being pushed aside on the lower end of the gauze by the flow of petrol. As for air locks, I have never had one, and I consider, without any hesitation whatever, that a properly designed "top-feed" carburetter is far more efficient than any other.

Furthermore, it never freezes. In the coldest of weather the carburetter answers as sweetly as on a mild summer's day. The machine will run continuously at walking pace, or roar up any hill on top gear at a good 40 m.p.h. At an average speed of 45 m.p.h. my petrol consumption is about 75 m.p.g.

"Top-feed" carburetters have no competition successes to their credit. Perhaps so; I cannot think of any, but time will show that for reliable efficiency at all speeds, in all weathers, and under the most severe conditions, the "top-feed" will prove itself superior to any carburetter on the market.

"TOP-FEED" SUPPORTER.

B.E.F.

### A Double-acting Two-stroke Engine.

Sir,—The following idea struck me the other day, and I should be glad to know what your readers think about it. It is the pump cylinder practice, but differs in that it is double-acting.

A and B are two cylinders cast together. B is a pump, while A is a common cylinder with both ends closed, also connected at both ends by transfer ports C D, with automatic valves opening into A. Also two sparking plugs are situated at the two extremities of A, while two exhaust ports EF are uncovered as in usual two-stroke design. Now the pistons in both A and B are closed at both ends and connected with shafts, which slide up and down in packed glands GH, outside which they are fixed to gudgeon pins. They then connect to a two-throw crankshaft, which allows B to be at the top of its stroke while A has only completed five-eighths of its travel. In B, besides C and D, there are two other ports at either extremity, which connect, through automatic valves WX, to a carburetter.

Now let us take the operations. B sinks towards H, at the same time sucking in gas through W. But between B and H there is a space filled with gas obtained from the last rise (through X); this is now pressed through D, and helps to drive out the exhaust gases through F. Just as B has started back, A reaches G, and is driven back after compressing the gas, which is now fired. Meanwhile B has reached the top of its stroke, and the whole performance is repeated.

L.C.J.

### Don't Teach Your Parent's Parent . . .

Sir,—Your contributor who uses the pseudonym of "Ixion" certainly manages to write a readable page in each issue, and I have often wondered how he maintained the steady flow of experiences. Such unusual experiences come to few of us, but then, perhaps, your readers are merely daily users of motor cycles, and cannot be expected to know as much about their mounts as a theorist must do.

Lately, however, the occurrence of mistakes has become a little too obvious, and I take a pen up to try to give your contributor a little help. I will touch upon several points on which "Ixion" seems misinformed.

1. CARBON ACCUMULATIONS.—The impression is steadily conveyed that a single-cylinder engine must require decarbonising at or under 2,000 miles. In the past four years I have owned two single-cylinder machines. No. 1

had a bore and stroke of about 65×75, and did 6,200 miles before it was taken down, and again 4,487 miles before I sold it in fine condition. No. 2 has a bore and stroke of 86×112, and has done 4,250 miles since I bought it in May, 1915. Practically all this mileage has been done with 150 lb. coach sidecar, mostly empty, but sometimes with two up besides driver. This engine is clean to-day, and shows no loss of efficiency or knocking. The names of these machines can be given, but I refrain from saying more than that No. 1 was a foreigner (Belgian), and No. 2 a Coventry-made machine of the big single type. I have also had experience of my brother's single-cylinder machine, a later type of the same machine as No. 1 above. This machine did a year's work, about 4,000 miles, and never came down at all.

2. THE INEVITABLE SNATCH OF A CHAIN DRIVE.—I use the words only as an impression from the bletherings of "Ixion." I have in present use the No. 2 machine mentioned above. It is equipped with all chain drive, and in use is smoother than a belt-driven machine. Of course, the engine sprocket has a good shock absorbing clutch, but so has every chain-driver of repute. This machine barely takes off the ribs of a Palmer Cord cover on the back wheel in 2,000 miles of sidecar work.

3. FOUR-CYLINDER MACHINES.—Here again "Ixion" writes from the fulness of an empty mind. It does not appear that he ever owned a four or ever rode one for more than five miles. Personally, I have had two, and, though a reasonably busy man, have done all my own work on them. One did not need to take the engine out of the frame, as "Ixion" covertly suggests, nor to decarbonise more often than every 3,000 miles. Granted that the job was a bothersome one because of scraping four pistons; but any four-cylinder user will laugh at the suggestion that the bicycle takes five or six times as much keeping in order as a single. No, it was not there that the shoe pinched, but rather in the lack of power for sidecar work.

4. SHAFT DRIVE.—"Ixion" remarks that in the present state of affairs shaft drive stands or falls with the four-cylinder engine. The shaft drive has been giving absolute satisfaction for five years on what is probably as good and efficient a single-cylinder lightweight as can be found on the market, albeit temporarily under a cloud of Germanic origin. I owned one, and rode it for 10,600 miles with regularity and with the minimum of attention. The drive never cost me a penny, nor did I ever take the cardan joint, shaft, or gear box down. The drive was unquestionably smooth and satisfactory. Tyre wear was quite normal. I have had experience of three other machines of this type, in all of which the users were charmed with the absolute efficiency of the shaft drive, as well as with its neatness and perfect protection from mud and wet.

Had the war not supervened (or intervened) it is probable the F.N. Co. would have placed a twin-cylinder machine with shaft drive on the market. Had this been so they would assuredly have secured my order.

Usual disclaimer applies, and I am a private owner.

NIXION.

["Ixion" remarks that the contents of the above are so much at variance with normal experience that he does not propose to reply at length. On the question of carbonisation, he points out that not long ago a leading article in *The Autocar* stated that the water-cooled engines of motor cars normally showed the effects of carbonisation after 2,000 miles running, and that any engineer will admit that air-cooled engines carbonise more quickly than the water-cooled types. On the four-cylinder controversy, "Ixion," curiously enough, received a long letter by the same post from Mr. Osborne Blythe, L.R.I.B.A., which commences, "I most heartily endorse every word you say," and goes on to remark that, though some four-cylinder engines can be decarbonised *in situ*, the job cannot be properly done unless the engine is dropped, and that the work will then take an amateur a day and a half to perform, as against the hour in which any smart amateur can decarbonise an accessible single-cylinder. If "Nixon" had, further, been cognisant with competition work, he would know that on more than one occasion the leading experts in the Scottish Six Days actually had their engines "cy cleaned" *en route* when slack supervision permitted it.—Ed.]

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Voltage at Plug Points.

**Q** I shall esteem it a favour if you will tell me the voltage across the points of a standard sparking plug from any good make of magneto.—J.G.

The voltage of a high-tension spark is roughly 25,000 volts for each inch of spark obtained. The average magneto will only jump a gap of  $\frac{1}{4}$  in. at the most, so the voltage would probably be in the neighbourhood of 8,000 to 12,000 volts.

## Adjustment of Contact Points.

**Q** Why should the fact of the platinum points separating a greater distance than the usual .4 mm. cause difficult starting and poor running, provided that when the points do meet a good contact is made?—B.J.

The contact points being adjusted with a wide gap should not affect the actual starting of the engine unless the gap was really excessive, but directly the engine commences to turn at any speed the wide gap would probably cause missing or sluggish running, owing to the fact that the points take a comparatively longer time to make contact when adjusted too wide apart.

## Storage of Petrol for Private Use.

**Q** I shall be glad if you will kindly inform me the quantity of petrol it is possible to store on ordinary private premises without liability, and also if there are any special conditions regarding storage.—A.J.

A motor cyclist is entitled to store not more than sixty gallons of petrol for private use if it is kept in two-gallon sealed tins made of metal and marked "Petroleum spirit. Highly inflammable." The tins must be stored not less than 20ft. from any building, timber stack, or other inflammable goods which do not belong to the motor cyclist, and if kept in a storehouse such storehouse must be thoroughly ventilated. If the storehouse forms part of a dwelling house, or building where persons assemble, it must have a separate entrance, and must be entirely shut off from such dwelling house or building by a substantial or non-inflammable partition or floor. If a motor cyclist cannot store his petrol in such a place as prescribed above he must apply to the local authority for a licence, in respect of which a small fee will have to be paid, and the requirements of Sections 8 to 15 of the Regulations for the Storage of Petrol, issued by the Home Office on the 31st July, 1907, must be complied with.

## Overheating and Excessive Vibration.

**Q** My machine is a 1913  $3\frac{1}{2}$  h.p. single, which I purchased second-hand. I have been much troubled by excessive vibration and overheating. The machine has been twice returned to the makers, but, except that the engine does not knock and overheat quite as much, it seems no better. I have tested the balance of the flywheels in the manner recommended by the booklet published by you on the subject, and find that the piston and connecting rod are much too heavy. Could I safely remove the weight by drilling the piston and connecting rod?—M.H.

Balancing an engine is a decidedly tricky job, and requires considerable care and skill. Are you perfectly sure that the piston is too heavy, according to the booklet? Most pistons will stand a considerable amount of weight being removed by drilling holes about  $\frac{1}{16}$  in. or  $\frac{1}{8}$  in. in diameter around the skirt, and the connecting rod may usually be lightened in a similar manner. But, in doing this work yourself, you should be absolutely confident that the parts do

want lightening, and also exactly how much metal requires removing, otherwise you may make matters considerably worse, as it is easy enough to remove the metal, but if you remove too much it is not so easy a matter to replace it. Before doing anything drastic, we would recommend you to make sure that the vibration is not due to the engine being insecurely held in the frame, or to a loose gear box or other fitting. We have known a weak or loose tank cause very bad vibration.

## Current Consumed by Electric Bulb.

**Q** Will a two candle-power bulb consume as much electricity as an eight candle-power, both of the same voltage?—R.H.

The two candle-power bulb will consume less current. Provided that both bulbs are of the same pattern, they will probably give about one candle-power per watt. Thus the two candle-power bulb will take .5 ampere at four volts and the eight candle-power bulb two amperes. Some of the smaller lamps are, however, not so efficient as this, and the small bulb may take as much as one ampere.

THE LIGHTER SIDE OF LIFE AT A DESPATCH RIDERS' TRAINING CENTRE.

The signs exhibited are "Garage and Pretorium" (presumably referring to a disused fowl pen) and "Repairs and Spies neatly executed on the Premises."

**Valve Clearance.**

**?** My  $3\frac{1}{2}$  h.p. machine, which has m.o.i.v., has fallen off in power, and on examining the machine I find that, although the clearance between the exhaust valve and tappet is not great, there is about  $\frac{1}{16}$  in. between the tappet and bell crank. Is this likely to affect the power, and should it be taken up, and about what lift should the valve have?—W.J.

The loss of power is in all probability due to the exhaust valve having insufficient lift. The tappet should touch the bell crank when the valve is closed, and there should only be about .4 mm. clearance between the tappet and the valve stem. The correct lift is governed by the design of the cam, and if this is not worn there is no need to trouble about it, provided all the clearance you mention is taken up. Also make sure the silencer outlet is quite clear and not causing back pressure. Faulty or weak piston rings might also cause loss of power.

**Gravity Fed Lubrication.**

**?** I am contemplating fitting a drip feed lubricator to my  $3\frac{1}{2}$  h.p. single. I thought of feeding the oil to the engine by gravity through a sight feed regulator. Would you tell me if this would be likely to be satisfactory, and could the oil be regulated as well as with the other types, such as those fed by a pump and spring or the suction feed types?—A.H.

The oiling arrangement which you suggest should be perfectly satisfactory, and, in fact, on several old cars this method has been used with perfect success. It is necessary to arrange for a non-return valve to be fitted between the engine and the lubricator. By doing this the system would be partly by suction from the crank case, and so would be equally or more satisfactory than the system employing only the suction of the engine. In cold weather you may experience some difficulty with the oil being thick and the supply varying accordingly. Large bore pipes will overcome this difficulty to some extent.

**Flooding Carburetter.**

**?** I want to alter the petrol level on the carburetter on my machine, as I think it drips too much below the jet when I flood it. How should I do this?—

A.H.

The fact that the carburetter drips after being flooded does not show that the petrol level is too high, as by flooding the carburetter you naturally cause the petrol to overflow. Provided it does not drip when standing, there is no need to interfere with the level. If, however, it does drip when standing, it may be caused through the needle valve requiring grinding in. The level can be lowered if absolutely necessary by sliding the little collar on the needle in which the toggle arms work slightly higher up the needle; that is, if these are fitted to the top of the carburetter float chamber. Take great care not to bend or damage

Thursday, April 13th.

THE MOTOR CYCLE

**ANNUAL SPRING NUMBER**

the needle. Hold the needle between two pieces of wood in a vice with the collar resting on the top of wood, and tap the head of the needle with a hammer.

**Backfiring.**

**?** I have a 1908 Triumph which has rather a high compression, and I experience great difficulty in starting owing to it backfiring violently. I have tried starting with the ignition lever in several different positions, but without much improvement. The magneto is timed so that the points break with ignition lever fully retarded and piston on top of compression stroke.—J.W.

The backfiring you complain of is undoubtedly caused either through having the spark lever too far advanced, or trying to start with the throttle too widely open. Try timing the spark as follows: Piston on top dead centre (firing stroke), ignition two-thirds retarded, contact points just separating. This position should give you ample retard to prevent backfiring; but with this machine, owing to the rather high compression, you would probably find that the spark might take place with piston on top and spark only half advanced without interfering in any way with the running. When starting do not give more than one-third to one-quarter throttle opening, and fully close the air. For easy starting a strong mixture, and very little of it, is best.

**Accumulator Charging.**

**?** Would you kindly tell me how to charge a 40 amp. 6 volt accumulator from a 230 voltage 10 amp. main (direct current)? At present I have wired a board with the positive wire running through three 230 volts 32 c.p. lamps to accumulator positive terminal, from negative terminal, back to main, with a switch between main and lamps.—F.F.

Your arrangement for recharging your accumulator seems to be quite correct. The larger the number of lamps inserted in a circuit, the greater will be the number of amperes at which you will be charging, provided the lamps are in parallel. It is also possible to connect up to the switch controlling a cluster of lamps; in this case you connect the two wires to the two switch terminals, the accumulator then acts as the switch, and the switch itself should be placed in the off-position. By connecting up in this manner the lights may be used for lighting purposes at the same time.

**Damaged Magneto.**

**?** Can you suggest a cause for the bad behaviour of my magneto?—It is a twin, and refuses to raise a decent spark on one of the plugs, with the result that at low speeds the engine will only fire on one cylinder. I have had it overhauled by a magneto specialist, but he has only succeeded in making the feeble spark rather more feeble than it was; and I have tried the effect of exchanging the plugs and the cables, and varying the gap of the points, with no greater success. It may assist your diagnosis of the trouble to know that it only developed after a fire, which reduced the machine to an unrecognisable mass of metal.—H.E.K.

You should look to all the following points: Make sure the carbon brush and holders are in sound condition and are not shorting anywhere, and that the distributor slip ring is not cracked or damaged, and is quite free from oil or dirt. See that the contact breaker is clean and that the rocker arm is quite free and not sticking at all; the points should separate about .4 mm. A damaged carbon brush holder is a very likely cause. If all these points are right, the trouble is undoubtedly due to the fire, which has probably destroyed the insulation somewhere in the armature, in which case you should send it to some really reliable firm of magneto repairers.

**EXPERIENCES WANTED**

"H.A.B." (Coventry).—Zenith carburetter on Scott. Consumption and acceleration.

"A.C." (Notts).— $2\frac{1}{2}$  h.p. two-stroke Allon; also Connaught and Campion. Speed, consumption, ease of starting, and reliability.

**RECOMMENDED ROUTES.**

**BARROW-IN-FURNESS TO NORWICH.**—W.H.P.

Barrow-in-Furness, Ulverston, Kendal, Kirkby Lonsdale, Ingletton, Settle, Skipton, Otley, Leeds, Pontefract, Doncaster, East Retford, Newark, Sleaford, Swineshead, Long Sutton, King's Lynn, Swaffham, Dereham, Norwich.

**LLANDUDNO TO UTTOXETER.**—D.P.

Llandudno, Llanrwst, Bettws-y-Coed, Cerrig-y-Druidion, Corwen, Llangollen, Ruabon, Overton, Whitechurch, Audlem, Woore, Blackrock, Stone, Uttoxeter.

**SHREWSBURY TO SOUTHAMPTON.**—M.B.

Shrewsbury, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Gloucester, Painswick, Stroud, Nailsworth, Bath, Frome, Maiden Bradley, Shaftesbury, Thickthorn, Ringwood, Lyndhurst, Totton, Southampton.

**PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.**

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always buying their regular supply of the journal each week. copies from the same place, if possible, or by giving a definite order to a newsagent for the

### Cult of the Sidecarrier.

We are informed that the General Electrical Co., Ltd., have recently taken delivery of a number of Harley-Davidson sidecarriers.

### Indian Spare Parts.

The London house of the Hendee Manufacturing Co. inform us that they have a large stock of spare parts—in fact, they have never been in such a good position as they are now for supplying parts. In view of last week's Proclamation prohibiting imports of cars and motor cycles, this announcement will relieve the minds of many Indian riders.

### Changes of Address.

The Rotax Motor Accessories Co. will shortly be moving from their warehouse and offices in Great Eastern Street and Curtain Road, E.C., to their works at Willesden. They anticipate that the removal will be completed by Easter, and in the meantime all correspondence should be addressed to Great Eastern Street.

Owing to increase of business, Messrs. Kemps' Vulcanising Co., Ltd., tyre specialists and repairers, have found it necessary to remove to larger premises, and are now installed at Nos. 48, 50, and 52, Hardman Street, instead of at No. 19, Hardman Street, Manchester. Messrs. Kemps are sole concessionaires for the British-made Burnett motor cycle tyres.

### Catalogues Received.

"The Ruffy-Baumann School of Flying" is a well-illustrated descriptive booklet showing methods of this well-known flying school. Flying headquarters are at Hendon, and offices and works at Kendall's Mews, George Street, Portman Square, W.

The Tyler two-stroke. The Tyler Apparatus Co., Bannister Road, Kilburn Lane, N. Kilburn, N.W. A booklet listing and describing the latest pattern Tyler two-stroke lightweight motor cycles, of the two and single-speed varieties. The company's showrooms are at 11, Charing Cross Road, W.C.

The Metropolitan Machinists' Co., Ltd., 248, Bishopsgate, E.C. A voluminous catalogue comprising pictures and illustrations of the various types of Juno motor cycles, two-stroke and four-stroke, sidecars for touring and industrial purposes, and the numerous accessories dear to the heart of the motor cyclist.

"The Derwent Sidecars." The Derwent Sidecar Co., Nottingham Road, Borrowash, Derby. This, the 1916 catalogue of the firm named, has come to hand, and it is a well illustrated production showing the different types of bodies listed.

Humphries and Dawes, Ltd., York Road, Hall Green, Birmingham. A very tastefully got up catalogue, illustrated in colours, of the latest types of O.K. lightweight motor cycles for both male and female riders.

E. A. Radnall and Co., Vauxhall Works, Dartmouth Street, Birmingham. The Radco two-stroke motor cycle. An extensive catalogue giving full information concerning these well-known lightweight machines, which are manufactured in types suitable for both sexes. The end of the booklet contains some interesting information regarding the timing of the engine. Also a leaflet concerning the 2½ h.p. Radco fitted with T.D.C. two-stroke engine.

### Reviews.

"Honourable Mention." This is the latest publication by the Harley-Davidson Motor Co. It is certainly a high-class and original booklet, which contains a series of photographs on art paper of various officers and men of the British and Allied Armies who are riding Harley-Davidson motor bicycles.

Brown and Barlow, Ltd., Witton, Birmingham. "All About Two-strokes." An interesting booklet dealing with the troubles and peculiarities of two-strokes, most particularly with regard to carburation. Though the information is chiefly intended for users of the B. and B. carburetter, many most useful hints and tips, which should be useful to the users of a two-stroke fitted with any carburetter, are given.

### Institution of Automobile Engineers.

The sixth ordinary general meeting of the session of the Institution of Automobile Engineers will be held on April 12th at the Surveyors' Institution, 12, Great George Street, Westminster, S.W., at 8 p.m., when Maj. B. W. Shilson, I.M.T., A.S.C., will read a paper entitled "From Engine to Axle." This paper is intended as a connecting link between the papers recently read by Messrs. G. W. Watson and W. D. Williamson, and the three papers together cover the whole field of the engine and transmission of the petrol-driven heavy motor vehicle.

### Lamp Shades.

For the dimming of windows and similar lights the Dunlop Rubber Co. have provided a range of shades for the use of traders, and a supply will be sent free of all cost on application to Aston Cross, Birmingham.

Mr. J. Mills, trading under the title of Mills Motors, Ltd., North Finchley, has joined the R.N.A.S. His stock of new and second-hand motor cycles and accessories has been purchased by W. H. Elcō and Co., at 16, Bishopsgate Avenue, E.C.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## Better Protection for Lightweights.

**W**E have often urged the necessity of better weather protection for motor cycles of all kinds, and have also published many letters from our readers confirming that insufficient attention is given to this important subject. Now the complaints apply especially in the case of lightweight machines. For example, a letter appears in the present issue from a correspondent, who is immensely pleased with his little two-stroke except in this one particular, and his letter shows that the absence of adequate protection from the elements has deterred many of his friends from buying a similar machine.

Naturally we expect that the need will be less vital during the months which are now to come, but in this country we can never count on the absence of rain, and consequently of mud, for more than a few days at a time, though it will be admitted that the mud dries up more quickly than in the winter. We hope, however, that makers will devote some part of the summer months to this question, and that the result will be that better weather protection is provided as a standard—at least when asked for—on every machine.

Shields can easily be made at home or by an intelligent mechanic, but we should be paying a very poor compliment to the manufacturers of high-class motor cycles if we suggested that these look as well as if they were turned out at the works—in fact, they are often unsightly, though undeniably useful. Until the mudguards over the wheels are really efficient some sort of splash guards are essential. These should be made and finished to match the machine to which they are to be fitted at the works; they should, too, be quickly detachable, so that they could easily be removed in fine weather. Surely all manufacturers could supply such shields when required by their customers without much trouble or the disorganisation of their mudguard department?

Of course, we realise that there are two sides to every question, and a leading manufacturer recently remarked to us, "It is impossible adequately to mudguard a machine without making it unsightly." Again, some riders do not use their machines in bad weather, and consequently a maker is reluctant to take from the appearance of his products by adding a fitment which is not universally required, but detachable shields supplied when wanted get over this difficulty. Granted they are not handsome, but a machine and rider covered with mud look very much worse.

The mudguard question needs very thorough attention. The valances fitted to many machines are not really as much use as one would suppose them to be, for the mud runs down inside and is blown back as it drips from the edges. In the case of the front wheel, much of this mud finds its way on to the engine and the legs of the rider, and in the case of both wheels on to the forks, whence it runs down to the hubs and other parts of the machine. When covered in the wheel itself gets extraordinarily dirty, and sometimes the mud collects in the guard and blocks the wheel. This trouble has been very prevalent at the Front, where despatch riders have been in some cases obliged to stop and clean out their guards several times in a single journey, and this when delays are not only serious but also dangerous. The function of mudguards should be to arrest the progress of all mud thrown up by the wheel, and finally to return it to the road, but not to deposit it all over the machine and rider. Some mud shields raise the dust excessively in dry weather. This is because they are so shaped that they tend to direct a draught of air downwards on to the road when the machine is in rapid motion. In wet weather this draught does no harm, but when mud gives place to dry roads the effect is unpleasant and should be guarded against, if the guards are to remain in position. There is much room here for sound theory and careful experiment.

### The Vulnerable Gudgeon Bush.

A brief but telling comment is to hand from Mr. Granville Bradshaw anent my surprise at his stating that the gudgeon pin bush is one of the weakest points of many modern engines. He cites two conclusive instances. One is that of a very famous water-cooled car in the possession of a friend of his, which wore its gudgeon pin bushes one and a half thousandths of an inch in its first 2,000 miles; as he says, a very little play at this point is very perceptible in a really well-balanced engine, though it may escape notice on a vertical single-cylinder. The other is that of an equally famous aviation engine, on which strengthening webs conduct heat from the piston head to the gudgeon pin bushes. Mr. Bradshaw says that a few hours' running suffices in this case to soften the gudgeon pins and dry all lubricant out of the bushes.

### Dynamo Lighting after the War?

One of the subterranean rumours going the rounds has reference to a complete revolution in our lighting system after the war. It is freely stated (with what truth I am ignorant) that several firms interested in lighting are going to make a real slash at dynamos for solo mounts as soon as the industry is freed from munition work. I have personally made thorough tests of several leading sets and cannot yet say that I have found a genuinely satisfactory solo set. Those which I have used were invariably disfigured either by troublesome batteries or by gimcrack details in other parts of the installation. Nevertheless, I am hopeful. The Lucas sidecar equipment may be said to have solved the problem so far as three-wheelers are concerned. The weight is not excessive, the

battery requires no attention except the addition of a little distilled water to the cells at regular intervals, the detail work is excellently designed and completely substantial, and the dynamo seems as reliable as a magneto, provided that its bearings are oiled every 500 miles. It is a simple matter to arrange a drive, say by Whittle belt, from a countershaft gear box.

### Electricity the Best Illuminant.

Time was—and not so long ago either—when I doubted whether the average rider would forsake acetylene in the near future. The crudest acetylene outfit can be made to work somehow, provided water and carbide are available; and a get-you-home system is a comforting possession. More refined developments, such as the Low generator and the D.A. cylinder, take a lot of beating. But, when all is said and done, there is nothing to touch the switch-on lighting systems for convenience. I am out most nights of my life just now, and I feel the difference more than I did. Moreover, I have garnered a lot of experience of first-class electrical outfits on sidecars and light cars; and I must confess that I should now plump for electricity every time so far as these vehicles are concerned. If, then, an electrical outfit of equal merit is soon to be offered us for solo work, nothing but price is likely to hinder its victory.

### Dry Battery Lighting.

Pending the arrival of improved dynamo outfits for solo machines, I have been using Hellenes dry batteries with Hunt lamps on my baby two-stroke. The head lamp does not give sufficiently brilliant a light for the best paces of which the two-stroke is capable; but,

A DANGEROUS CORNER ON THE COACH ROAD FROM COCKERMOUTH TO BUTTERMERE AND HONISTER PASS, LAKE DISTRICT.

The winter gales have swept away a portion of the wall which guards the motor cyclist from a fall into Crummock Lake at this point, and a few days ago the wall was still unrepaired, though it has been in this state since last December.

## Occasional Comments.—

after all, few of us scrap after dark, and the light is amply good enough for legal limit average. The tail lamp has a cunning little switch which no street urchin has yet discovered when the machine is left against the kerb; and the two small batteries are going strong after five months of intermittent work.

## Frequent Decarbonisations.

Mr. V. Olsson is the latest critic of my remarks about too rapid carbon accumulations in the average engine; but I am incorrigible, and believe his counter-evidence only serves to bear out my point. Mr. Olsson is one of our crack riders, *i.e.*, he may be trusted to obtain the best results, which will include such normal precautions as tuning his carburetter far better than the stock carburetter is tuned, and observing great precision in oiling. Now in these matters I always try to represent the man in the street, who in this connection will be more or less of a duffer, who will probably use the maker's carburetter setting (often something of a lottery), who will oil on the system of "when-in-doubt-give-her-two-extra-charges," and who will emphatically *not* use oil at 7s. per gallon. I may be quite wrong, but I still think that few riders among the rank and file of motor cyclists get 2,000 miles between decarbonisations without a pronounced loss of efficiency. I will alter my opinion when I meet a decent number of average duffers who get 4,000 miles on one clean-out (Mr. Olsson is not exactly an "average duffer"). Of course, my obvious motive in drawing attention to the point (whether I have innocently exaggerated it or not) is to press for more refined lubrication systems, which will reduce the frequency of decarbonisations, without making marked demands for oiling precision on the part of individual riders.

## A Garage Incident.

A well-known soldier motor cyclist sends the following yarn. Scene, a garage near a large encampment. Enter, Sec.-Lt. Sir Something Blank, followed at a respectful distance by a perspiring Tommy pushing a derelict two-stroke. Two mechanics welcome H.M. Forces. Derelict two-stroke is put on stand, gear engaged, and back wheel turned. Derelict two-stroke proceeds to emit noise reminiscent of a suburban lawn mower cutting a gravelly lawn. Mechanics diagnose a slipped ignition timing. Mechanics (N.B.—They are war time mechanics) feel for piston with a spoke to verify timing. Piston cannot be found. Cylinder removed in search for piston. Piston discovered in fragments at bottom of crank case. Epilogue (spoken by Sir Something Blank): "Is there much to mend?"

## Oil Straining.

My attempts to be sarcastic proved rather incomprehensible, and a generous reader promptly replied offering to present straining gauzes to a limited number of riders. I have no reason to suppose there is an actual shortage, but merely used the manufacturer's stock wartime excuse for an ironic gibe at a firm who supplied me with some very dirty oil. I only allude to the matter again in order to publish a tip. The circumstances are that my "baby" two-stroke, afflicted with petrol lubrication, floods at intervals on every ride, because the oil is full of foreign matter, and bits of dirt get under the float needle. When I notice that the carburetter is flooding, I twist the needle round with thumb and finger pressure against its seating, and the flooding always stops immediately. This tip would, of course, be bad for the needle if the foreign matter were of a metallic or gritty nature.

## PUBLIC SCHOOLS AND THE MOTOR CYCLE.

THE cycle car here illustrated is the property of Mr. Frank Bower, now at Sandhurst, and was made by him under somewhat difficult conditions in the carpentering shops at Repton School during the Easter term, 1915. The frame is made of ash, while the body is composed of canvas and sheet steel. The engine is a 6 h.p. J.A.P., which is situated

Transmission on the Repton-built cycle car.

Cycle car built at Repton by Frank Bower, who is now at Sandhurst.

behind the seats, driving by belt a Sturmey-Archer hub gear fitted in the tail of the vehicle. Instead of a wheel there is on the hub body a belt rim which drives on to a pulley of equal diameter on the back axle. The car is suspended on five spiral springs, and is most comfortable, we are informed, on bumpy roads. The steering is by means of a shaft and chain. The body is upholstered with American cloth. Since it was first constructed the car has been greatly improved, and is, we are informed, now capable of attaining 40 m.p.h. with two up.

**W**ITH petrol at its present price and possibly higher during the coming season, economy of fuel becomes of primary importance. It is comparatively easy so to adjust carburetters to give more miles per gallon if one at the same time accepts disadvantages such as less easy starting and reduced power. As a matter of fact, the adoption of smaller jets, reduced levels, and larger choke tubes can be carried to excess, resulting in wasteful consumption because the air velocities are not high enough properly to vaporise the fuel. One desires improvements in every respect, and some successful experiments of mine with an Amac may be of service. My aim has been perfect vaporisation, giving complete combustion in the shortest practicable space of time, and these principles have also given good results in the case of the automatic carburetter on my light car.

I have a  $3\frac{1}{2}$  h.p. T.T. Rover, single speed and fixed engine type, which on average roads at an average speed nearly 50% above legal limit runs 115 miles per gallon of No. 2 petrol, and this without any attempt at economy other than carburetter alterations. It is fitted with an Amac 32 jet and petrol level as set by the Amac Co.

#### Covering the Induction Pipe.

By an alteration of the vaporising jets the consumption has been improved from 85-90 m.p.g. to 110-115 m.p.g. On the Rover model in question the magneto is behind the cylinder, whilst the carburetter is behind the magneto, so that there is about 4in. length of induction pipe, and this I have covered with sheet asbestos. (When soaked in water sheet asbestos becomes pliable and can be bent into any shape without cracking; on drying up it conforms to its new position.) A greater volume of heat is thereby conveyed

## IMPROVING CONSUMPTION.

How an Amac Carburetter was altered to give a Consumption of 115 m.p.g. on a  $3\frac{1}{2}$  h.p. Machine.

to the body of the carburetter than if the pipe were exposed throughout its length to cooling breezes. The interior of the pipe being thoroughly hot precludes any vaporised petrol from condensing on the walls and drifting into the cylinder as a liquid. The alteration which effected the improvement in consumption mentioned was made as a result of watching the action of the jets whilst the engine was running on the stand. While the throttle opening and engine speed remained constant, there was no noticeable efflux of petrol, the fuel apparently being sucked by the air current direct off the tops of the holes in the form of vapour or very fine spray. As the throttle was opened a trifle, however, causing immediate increase of engine speed, comparatively large drops of petrol were noticed to jump out of the central holes. It is obvious, therefore, that with this type of carburetter, at every

acceleration of air velocity through the choke tube, drops of petrol emerge from the central holes—being immediately over the main jet—and drift into the cylinder only partly vaporised, and consequently indifferently mixed with air. This sudden efflux of petrol at changes of air velocity is inevitable. My aim, therefore, was to secure an even flow from the six holes instead of from the central pair, and, further, to break up

Method of improving petrol consumption of Amac carburetter by breaking up the petrol as it leaves the jet.

the drops at the jet instead of trusting to the heat of the induction pipe and cylinder to complete the vaporisation. It must be remembered that the carburetter in question is not fed with warm air, and that a drop of petrol travelling in a current of cool air, even at high speed, resists disintegration to a considerable extent.

#### Breaking Up the Petrol.

To obtain the best results it is essential that the breaking up of the globules of fuel should take place at the jet or jets assisted by a high velocity current of warm air, and not in the induction pipe or cylinder. Knowing and appreciating the difference between

# War Time Economy

# Sunbeams IN THE FIRST FRENCH LINE

## EXTRACT FROM LETTER.

"The Motor Cycles you supplied to us some time ago for the transport of Wounded French Soldiers in the Vosges Mountains have done, and are still doing, most excellent work in the first line of the French Army. These Cycles are spoken of in THE HIGHEST TERMS by all who have come in contact with them in France."

What satisfaction is expressed in these words—recognise the difficulties of heavy ambulance work over any and all sorts of so-called roads which strains every part and portion of the machines.

SUNBEAMS under such a test are spoken of "IN THE HIGHEST TERMS." No better testimony is needed of the Reliability, Workmanship, and Superiority of SUNBEAMS.

Owing to the great demand for Sunbeam Motor Cycles for War purposes, the public are respectfully informed that further deliveries cannot at present be made from the Works, and those who require Sunbeams should purchase the existing stock of the various Agents who have had the foresight to provide for this contingency.

# Norton

## The Best General Utility Machine.

The  
**NORTON COMBINATION.**

If you are looking for a side-car combination which provides all that a passenger can desire in the way of comfort, you should order a Norton. It is a well-designed model, excellently sprung, with well finished coachwork, comfortably upholstered, and very handsome in appearance.

### An Enthusiastic Amateur's Opinion.

Extracts from an article by Capt. A. Lindsay, A.B., which appeared in "The Motor Cycle" on January 6th, 1916.

- ☐ "All my three machines have been Nortons, and all have given excellent service."
- ☐ "Their simplicity nearly equals that of the average two-stroke."
- ☐ "Running costs are probably as low as any other type of machine on the market."
- ☐ "I have not experienced a single mechanical breakage, and I have never failed to get home under my own power."

Write for Illustrated Catalogue.

**NORTON MOTORS, LIMITED,**  
Sampson Road North, Birmingham.  
London: Partlett & Co., 74, Gt. Portland St.

4 h.p. Norton, with Sidecar.

In answering these advertisements it is desirable to mention "The Motor Cycle."

**Improving Consumption.—**

circular and annular openings, I enlarged the central holes and inserted pieces of pin, see sketch. With the central holes thus treated, another test on the machine showed that petrol emerged in drops from the outer holes, whilst from the inner ones it came out in fine spray. The obvious cure was, therefore, to treat all exits alike, except that to secure approximately the same rate of efflux the outer holes had to be less choked than the inner. As the result of experiments this effect was obtained closely enough by making the holes of varying sizes and using pins of various sizes, several small ones being better than one large one.

No drops of petrol are now visible; the spray on accelerating may best be likened to the Niagara Falls—upside down. Opening up the throttle causes an upward rush of fuel in the form of a sheet of very finely divided spray across the track of the air current.

It is of interest to consider the results of improved atomisation. Although, when the petrol reaches the cylinder in the form of drops, only a portion is burnt during the stroke and the rest is wasted, it is obvious

that when the fuel is completely vaporised the whole of it is efficiently burnt even at extra high piston speeds.

**More Power and a Cooler Engine.**

It follows also that with the same quantity of petrol more power is obtained, also that the engine will run cooler, the combustion being completed early in the stroke. In practice I find not only the improved consumption mentioned, but also extraordinarily cool running and freedom from sooty deposit; also the valves last well.

One disadvantage only I think I perceive in this system—the explosion strokes seem a trifle harsher at slow engine speeds, due probably to the extremely rapid development of the combustion. The engine is certainly more responsive to movements of the throttle, air, and ignition levers; and in the case of the air the position for best running at any moment is easily found. A little movement of the lever either way from the best position slows the engine. Finally, I may say that the alteration has not been attended with any loss of power or of speed.

J. W. G. BROOKER.

## CARE OF BOWDEN CONTROLS.

Prolonging the Life and Improving the Working.

IT is impossible to obtain the best results out of one's machines unless the controls work smoothly and easily, permitting a proper degree of delicacy in their movement, and as winter proceeds one finds scores of machines sorely in need of attention in this direction. Worn Bowden controls are often a source of trouble and annoyance, but, if properly looked after, they will wear indefinitely, whereas if neglected a single winter may spell their ruin.

**Clipping the Wires in Position.**

It is a good plan to go carefully over each wire, and first arrange it so that no sharp corners are formed; then bind the wire securely to the frame with insulation tape at every convenient point, taking care that it will not be trapped or strained by the movement of the handle-bars. Remember that these wires are subject to constant movement, so that if at any point they are held between two sharp or rough surfaces, the friction will speedily wear through the cover. To avoid this, wrap the cover with

Where Bowden cable rubs against screws or sharp corners wrap it round with insulating tape to prevent it fraying and wearing through.

insulation tape at all such points so that a firm pad is formed between the cover and the rough surface on which it bears, as shown in the second sketch. If the wires are carried inside the frame, they will

not be provided with waterproof covers, and therefore they will be susceptible to moisture at all points at which they are exposed to the weather. This kind of wire is easy to deal with, as one has simply to run

Method of lubricating Bowden cable.

oil over the outside of the casing and it will soak through to the cable. The objection to the naked casing is that, if kept properly lubricated, it is unpleasant to handle and leaves oily smears wherever it touches; and being exposed to the weather at certain points there is no alternative but to keep it properly oiled. Of course the most permanent job is to allow it to simmer in tallow; then remove all external grease before replacing, and, this done, it is worth while binding it to the handle-bar with a waterproof cover of insulation tape between the controls and the point at which it vanishes underground.

**Lubricating External Wires.**

External wires, provided with waterproof covers, though difficult to lubricate, seldom require oiling. Having ascertained that the casing is sound, dilute a small quantity of oil with petrol, then wrap an inch or two of the ever-useful insulation tape round the cover at the point at which the cable enters, thus forming a small cup. Into this the diluted lubricant is introduced, drop by drop, till sufficient has percolated down to reach the entire length of the cable. In a few minutes the petrol will have evaporated, leaving the pure oil alone.

If these hints are carefully followed motor cyclists will find that their Bowden wires will give no trouble and will wear indefinitely.

—H.M.B.

# HIGH-SPEED ENGINE DESIGN.

## Some Points which must be kept in View.

**T**HE modern motor cycle engine has gradually developed into an efficient high-speed engine, therefore in the following article the writer proposes to go over a few points in the design of an engine which must be capable of developing high power for a given cylinder capacity and attaining a high rate of revolution.

### Cylinders and Combustion Heads.

Naturally air-cooling must always have a big claim in motor cycle engine design, because of its simplicity and the little attention needed on the part of the owner against the extra complications, weight, and care necessary for water-cooling. The question of overheating need hardly be considered because air-cooling has been brought to an art. As an example of the efficiency of air-cooling we can take the Rudge seven-hour record made on Brooklands, in which the last hour was run at a faster speed than the first.

The design of the combustion chamber has a direct bearing upon the "thermal efficiency" of the engine. The chief shapes of combustion heads used in motor cycle engines are shown in the diagrams. Fig. 1 shows the most common type with side-by-side valves.

This form of combustion head is the most inefficient of the three shown. The area of metal in contact with combustion per volume of combustion chamber is too great when utmost efficiency is aimed at.

This design also necessitates valve caps, which absorb a great amount of heat but radiate little. The overhead inlet valve type is shown in fig. 2; this type is an improvement over fig. 1 because the metal area is less, while the design does away with the heat-absorbing valve caps. Fig. 3, in which both valves are in the cylinder head, is the most efficient from the point of view of "thermal efficiency." The gases have a direct flow into and out of the cylinder, which is a distinct advantage over the preceding types.

Fig. 1.

Position of valves.  
Fig. 2.

Fig. 3.

### Valves and Cams.

With respect to valve lift areas and port design, it must not be forgotten that these are controlling factors in the power developed. Large valves with streamline ports to suit are essential. In discussing valve sizes, it is the inlet which is of primary importance. We can get rid of the exhaust gases; the point is how to coax a full charge of gas into the cylinder. The ratio of the volume of gas taken in per stroke to that swept out by the piston per stroke is known as "volumetric efficiency." It is obvious that this must be as high as possible to obtain the best results. The passage of all gases should be subject to the minimum restriction. Getting the gas out of the cylinder is a positive pumping action; it is getting it in that makes or mars the engine. The four-stroke engine is a combination of pump and prime mover. The successful high-speed engine must be a first-class

gas pump, and is successful in direct proportion to its pumping capacity. Frictional resistance is opposed to the gases passing into the cylinder, therefore it is necessary to employ large valves and ports giving a direct flow to reduce the amount of friction per volume of gas passed through, so as to prevent throttling at high speeds.

Cam profiles are a matter for consideration where power is needed. The valves must be lifted quickly, and the power required to compress the springs must be as low as possible. Therefore a quick-lift cam with a large radius at the cam fillet is one of the best types. The difficulty of closing a large valve at high speeds must not be overlooked, and all reciprocating valve gear must be made as light as is consistent with safety.

### Reciprocating Parts.

It is common knowledge that light reciprocating parts are necessary for high speed and high power output. There is a common tendency to assume that a light piston is of benefit because less power is required to drive it, which is hardly correct, as whatever amount of work is actually performed in accelerating a piston from rest at the top of the stroke is all given up to

the crank pin when the piston comes to rest at the bottom of the stroke.

Heavy pistons do not call for the performance of unnecessary work, but the heavy piston causes a greater load to be put on the connecting rod

and crankshaft bearings. Every ounce taken off the piston and connecting rod weight reduces the load on these bearings by pounds. The same amount of power is given off by the explosion with either light or heavy reciprocating parts, but a light piston and connecting rod will reduce bearing loads, friction, and vibration. Therefore, with light reciprocating parts a greater percentage of the power given off by the explosion is available at the engine shaft.

### Balance.

Is perfect balance necessary in the design of a high-speed motor cycle engine? Theory says it is, but we have often to modify theory, especially in the design of a motor cycle engine. Of course, absolutely perfect balance must always have precedence where it can be applied. But the motor cycle engine is a compromise. To take an example, we cannot have perfect balance in a single-cylinder engine, but have we to scrap the single, which has made its way and justified its claim, because according to theory it is badly balanced? If we were considering the design of a high-speed engine of 50 h.p. of course a single-cylinder would be out of the question, but with the small motor cycle engine, where we can get over 3,000 r.p.m. with a single cylinder, perfect balance is not necessary, although it is to be preferred.

The usual plain bushed connecting rod bearings, which are lubricated by splash, have always been a

**High-speed Engine Design.—**

source of criticism. The hand pump splash system of lubrication is accused of being entirely inefficient, while the bronze bushes under these conditions are said to be worn out in one thousand miles in many instances. Forced lubrication is advocated in many quarters. If it were adopted on motor cycle engines, the writer does not think it would prove as great an advantage as on large engines. Forced lubrication does reduce friction, but it has been proved by test that the reduction is not in proportion to the pressure. To the writer's mind forced lubrication of a plain bearing is not finality in bearing design; the roller and ball bearings seem to have a greater claim. The ball bearing has been used for motor cycle engine main bearings with success for many years. The roller bearing has been improved greatly of late years, and now it has made good. Roller bearings have been known in different forms for many years, but without success, chiefly because long rollers were used which had a habit of twisting out of parallel with the axis of the shaft. In these early rollers wear used to take place through the rollers binding and skidding on the shaft, and serious end thrust was set up. The rollers of to-day, which have a length equal to the diameter, run with precision. A roller bearing of the same size as a ball bearing will take a greater load with little more friction, provided it is well designed.

**Small Starting Effort.**

In roller and ball bearings the starting effort is very little more than the running effort, which is a great point in their favour. With a well-designed roller bearing of nearly pure rolling action the friction is almost independent of speed. Then, again, the roller bearing needs very little lubrication—in fact, if rust could be prevented it would run nearly as well without. Oil under pressure is fed to the plain bearing with the object of keeping the bearing surfaces apart to prevent friction as much as possible. By using roller bearings we bring friction down to a minimum with-

out the complications of forced lubrication. The roller bearing is more robust than either the white metal or bronze bearing. A failure of the oil supply and bang goes the plain bearing, be it bronze or white metal; not so with the roller bearing, it would still keep running.

**Inside and Outside Flywheels.**

Which is the better position for the flywheel, inside or outside the crank case? Let us consider the claims of each. The advantage of the inside flywheel is that it is protected and out of the way in case of a fall. That is about the only advantage, while its disadvantages are that its diameter is limited, therefore it has to be made heavier to give the same turning moment, and there is always an appreciable amount of oil friction between flywheel and crank case. The outside flywheel can be made larger in diameter, therefore its weight is lighter than the inside flywheel; consequently the load on the main bearings is decidedly less; also oil friction between flywheel and crank case is eliminated. From the above it would seem that, all things being equal, the engine with the outside flywheel should give the greatest acceleration and the highest speed.

In the opinion of the writer the following points go towards making a successful high speed engine:

Air-cooled horizontal twin.

Large overhead valves with clean streamline ports.

Light reciprocating valve gear.

Pistons and connecting rods to be as light as is consistent with safety.

Roller bearings throughout with trough lubrication.

Outside flywheel.

Although the writer favours the horizontal twin, he thinks that the V twin or single-cylinder designed on the same lines is practically as good. Although the twins are gradually gaining favour, the single will hold its own for many years yet to come, if not always.

G.W.

THE MOTOR CYCLE INDUSTRY AND THE WAR.

A big batch of 2½ h.p. Douglas bicycles and 4 h.p. sidecar outfits of the same make ready for delivery to the War Office. It is a most imposing array, there being five long rows of solo machines, arranged side by side and close together, and two rows of sidecars.

### A Further Selection of Letters from Readers scattered all over the World.

**I**N the first issue of each month this year we have given extracts from letters received by us from time to time from our readers Overseas, believing that such an interchange of experiences will be for the general good. These letters are interesting, as they show very clearly the circumstances under which motor cycles have to work in these far away lands, where conditions are so varied and different from those obtaining here in England. It will be seen that the selections for this month are chiefly from Australia, especially New South Wales, and New Zealand, and undoubtedly the reason so many letters emanate from these countries is that of all the British dominions motor cycling is undoubtedly more popular, and is indulged in to a far greater extent, in Australasia than in any of the others, with the possible exception of South Africa. It is decidedly cheering, in reading extracts from some letters written in the cold cheerless months of January and February, to read of temperatures of 100° in the shade and upwards; of course, as everyone knows, these months are the height of summer at the Antipodes, and when one thinks of the bad road conditions, as well as these high temperatures, the difficulties under which the air-cooled engine works will be more appreciated. When one realises the varying conditions existing in the different countries it can be clearly seen that a machine which may be ideal in the eyes of the British rider is not by any means the most suitable for Overseas riding, and it is certain that there is an opening in the Dominions for more examples of specially constructed Overseas models of all-British mounts, which should be specially built and specially sold for these countries, and great business should be done by the manufacturer of these motor cycles who, realising the wants of the colonial riders, provides them with a good machine suitable for the work, and sees that it is not only supplied at a reasonable figure, but also arranges that there shall be no difficulty in obtaining spares.

It is most certainly some source of gratification for the various British manufacturers, who are now engaged producing munitions of war, to know that the Overseas demands for British-made machines are far and away in advance of supplies. Probably at the best of times the Overseas demand would exceed the total output of most of the British factories, and now that such hindrances as export licences and the great lack of boats exist, it will be clearly seen that the British manufacturer is exporting under very great difficulties.

J. Dutton, who is now serving with the Union forces in the German East African campaign. He is the builder of the motor raft described in our last issue, and also the man who underwent such unpleasant experiences in a ride from Johannesburg to Bloemhof, when water in the acetylene generator saved him from collapse. His mount is a B.S.A.

There is no doubt that the Board of Trade is a very overworked branch at the moment, but there is certainly a lot of time wasted in issuing these licences, as was shown in our issue of March 23rd, when we gave the experiences of some of the leading manufacturers on this subject. The American manufacturers have always made a fair bid for the Overseas trade by their smart business methods, and now that total prohibition of foreign-made machines has deprived riders of the home market it is likely that they will increase their efforts to gain extra business in connection with the Dominions in order to make up for the lost business here, and it is to be feared that the struggle for the British motor cycle manufacturers, whose outputs are reduced by the making of munitions, to hold their own with this renewed effort will be thus rendered more difficult.

#### A Stiff-tailed Grid.

MR. H. F. WISE, Auckland, New Zealand: "Frames break too often out here. I have had two frames break simply through the rough road conditions. Rigid frames are too uncomfortable on our roads, and I have given them up in favour of a spring frame Indian, and, having once experienced it, intend never to return to a stiff-tailed grid."

#### Handle-bar Controlled Clutch.

MR. H. C. MANSFIELD, Goulburn, New South Wales: "A handle-bar controlled clutch is a great advantage, as often we have to negotiate stretches of sand with steep banks, which make it impossible to ride the machine, consequently it has to be pushed. With the handle-bar controlled clutch, however, one can walk alongside, allowing the engine just to pull the machine."

## Overseas Letters.—

## Mudguarding.

MR. A. V. HARRIS, Canterbury, New Zealand: "Most of the machines sold here are very poorly equipped as regards mudguards, especially on the rear wheels. Spring frames with a low riding position are wanted for this country, and, above all, better mudguarding. Makers do not seem to grasp the fact that machines that may be perfect for use in the United Kingdom are sometimes useless for Colonial use."

## American Machines and Spring Frames.

MR. EDGAR BEALE, Sydney, New South Wales: "There is plenty of money here, and a splendid motor cycle trade is open to anybody who pays attention to the wants of motor cyclists. Personally, the writer uses an Indian motor cycle, but that is merely because it has a spring frame. If British manufacturers will only provide reliable and efficient spring frames I am very sure that the British machine will easily hold its own here. There is a certain prejudice against American machines, and they have not got the finish and the sturdiness of those of British manufacture. The conservatism of the home manufacturer will certainly have to be cast to one side if success is to be won."

## The Necessity of Overseas Branches.

MR. C. M. THYNN, North Ryde, New South Wales: "Undoubtedly the remedy for the exorbitant and fluctuating prices demanded out here for British machines is for the manufacturers themselves to open local branches, or at least an Australasian office to safeguard their interests, and I certainly think this will take place directly the manufacturers fully realise the possibilities of the Australian and New Zealand markets. The Americans have already made a beginning in this direction."

## Difficulty of Obtaining Spares.

MR. A. B. THOMAS, Henderson, New Zealand: "One of the greatest inconveniences with a British-made machine is the difficulty of obtaining spare parts. It often takes four to six months to secure replacements. One of the largest dealers, who is sole agent for a leading make of engine, informed me, when applying to him for a new cylinder for this particular make of engine, that he did not stock spare parts. If one writes direct to the manufacturers in England they usually refer you back to their agent, so causing much delay."

## Costly Spare Parts.

MR. R. LOGAN, Botany, New South Wales: "It would be a great thing if the British manufacturers would insist that their Overseas agents are to carry a large stock of spare parts in a similar manner to the American firms. I recently required a new valve cap for my J.A.P. engine, but was unable to obtain one in the whole city of Sydney, and eventually had to have one made specially at a cost of 8s."

## A HOT PART OF THE WORLD—IN TWO SENSES.

A Scott rider in a warm corner, i.e., Nairobi, East Africa.

## No Police Traps.

MR. R. J. DYER, Little River, New Zealand: "Little River is forty miles from Christchurch. I do this journey nearly every week-end, and it usually occupies about an hour and a half—a good road and no police traps to prevent you having a T.T. if you meet another sportsman looking for trouble. Should any readers ever come over here I would be pleased to show them round. Climbing is plentiful everywhere you turn, and with good roads."

## Motoring in High Temperatures.

MR. W. E. HILLERMAN, Babranald, New South Wales: "For motor cycling out here something might be done to improve the cooling. The temperature in this district often goes as high as 160° in the sun, which necessitates liberal doses of lubricating oil to prevent pre-ignition. Repairs and accessories are very expensive in the country districts. Petrol is also a serious item. I have to pay as much as 27s. 6d. for a case containing eight gallons. At the time of writing (January 22nd) the thermometer stands at 112° in the shade, although it is only 11.30 a.m."

## Tyre Troubles.

MR. N. B. PATT, Merewether, New South Wales: "The tyres usually fitted as standard are not nearly large enough. Nearly all passenger machines here are fitted with 700×85 tyres on the driving wheel and 650×65 on all others. Very few machines are built with sufficient clearance between the forks to allow these tyres to be fitted. A puncture is a terrible business to repair out here in the hot weather, as the patches will not stick with the thermometer at 105° or more. I long for the day when detachable wheels are standard fittings. I have read about them in *The Motor Cycle*, but have not yet seen a machine with them fitted."

## Rough Roads Round Sydney.

MR. W. B. PYNOR, Parramatta, New South Wales: "Our famous roads would make good trial runs for despatch riders, those within one hundred miles of Sydney being almost impassable, the main road from Parramatta to Sydney, a distance of fourteen miles, being absolutely so. We have to go over one hundred miles from Sydney to get a sufficiently good piece of road to hold any long races over. A good strong machine with plenty of power and ground clearance is essential. My 4 h.p. Bradbury seems to fill the bill for solo work. American machines are now having a great vogue out here, as they are powerful machines and sold at a reasonable price."

## MOTOR CYCLING IN DENMARK.

Two of the competitors in a recent reliability trial starting and finishing at Copenhagen. Bohstedt (Indian) and Tidemand (American Excelsior).

### TIMES TO LIGHT LAMPS (GREENWICH TIME).

April 6	...	...	7.8	p.m.
" 8	...	...	7.11	"
" 10	...	...	7.14	"
" 12	...	...	7.18	"

### Next Week's Spring Number.

The *Motor Cycle* Spring Number has become an annual institution. In the next issue, dated the 13th inst., will appear articles and illustrations of a nature attractive to men in the united services and civilian alike.

### Motor Cycle Competitions.

The B.M.C.R.C. intended to run three naval and military motor cycle race meetings at Brooklands this year, but in view of the Government attitude towards unnecessary motoring, and the necessity for economy in petrol, it has been decided to abandon the idea of holding these for the present.

### The Deterioration of our Roads.

If any motor cyclist ever doubted the advisability of our spring frame campaign, let him try a motor bicycle or sidecar over one of our main roads *NO*W. Some stretches on famous highways are atrocious, and positively dangerous to single trackers in the dark if the rider happens to be a stranger to the neighbourhood.

### News!

The *Motor Cycle* was able to forecast the general tail light Order, and afterwards the new lighting regulations by means of paper discs, before any other journal. It also announced the 33½% import duty on motor vehicles last autumn before any other technical journal. It was hoped to include in the present issue the latest Budget decisions in the matter of new taxation, etc., as they affect motor cyclists.

### Birmingham Club's Open Trial.

We have already given publicity to the open reliability trial for service men and munition workers that the Birmingham M.C.C. propose holding on Easter Monday, April 24th. Trials Honorary Secretary W. H. Egginton tells us that from enquiries and entries already received the trial promises to be a success, "but we wish to make a huge success of it, and this can only be done by the aid of *The Motor Cycle*."

Judging by information with which we have been supplied the course will be a

distinctly sporting one, though no freak ascents or secret checks will figure in the programme. Arrangements are being made that will ensure a supply of petrol for all competitors. All particulars can be obtained from Mr. W. H. Egginton, 76, Earlsbury Gardens, Handsworth, Birmingham.

### Paraffin as a Fuel.

A correspondent who has made an extended test of paraffin on his 4½ h.p. James sc. tells us that he finds no more carbon deposit than when using petrol, and also that what deposit is present is softer and more easily removed.

### The A.C.U. and Competitions.

In view of the attitude taken by the Government towards the unnecessary use of motor vehicles and the impression it has created upon the public, and, furthermore, the necessity for economising in petrol, the A.C.U. has expressed its opinion that, having regard to present circumstances, no motor cycle competitions should be held during the existing conditions.

### SPECIAL FEATURES.

MORE SPRING FRAMES.  
HIGH-SPEED ENGINE DESIGN.  
IMPROVING CONSUMPTION.

### Petrol Up Again.

Petrol—that is, the petrol one can buy—has gone up 2d. a gallon, and the best quality now costs 2s. 8d. Shell best quality motor spirit still remains at 2s. 2d., but as it is practically unobtainable, the lower price is only of benefit to the lucky few who are able to obtain it.

### Racing in New Zealand.

The Pioneer Motor and Sports Club, of Christchurch, have held another race meeting on the New Brighton beach. The date was February 12th, and two events only were held. Results:

20 MILES SOLO HANDICAP.	
	Handicap.
1. G. Moffat (4 Triumph)	3m. 0s.
2. C. Bonnington (4 Triumph)	3m. 30s.
3. W. Hollobon (4 Triumph)	1m. 45s.
20 MILES SIDECAR HANDICAP.	
1. A. Woodham (10 Henderson)	scr.
2. F. O. Thomas (3½ B.S.A.)	1m. 30s.

### A WARNING TO ROAD USERS.

The devastating effects of the great blizzard of last week are now well known. At the same time it is as well to warn road users that owing to the scarcity of labour there may still be many trees that have fallen across main roads and not been entirely removed by the time this issue appears. This photograph shows a typical scene in the Midlands at the last week end.

**"The Motor Cycle" Spring Number.**

As already announced, *The Motor Cycle* Spring Number, to be published next week, will contain a number of special articles, of which the following is a summary:

**"REMINISCENCES OF BYGONE TRIALS"** is by a veteran competition rider, and is illustrated with scenes of 1909, 1910, 1913, and 1914 trials.

**"HILL HUNTING ADVENTURES IN LAKELAND."**—Needless to say, this is by G. D. Abraham, and it is illustrated by some of the author's photographs.

**"WEIGHT AND HORSE-POWER."**—An article to show the relationship of weight to cubic capacity.

**"LADY MOTOR CYCLISTS ON THE LAND."**—Miss May Walker.

**"THEN AND NOW,"** being verses of a topical nature, with a special drawing by Oswald Cunningham.

**"ANGLING ANECDOTES."**

The issue will also contain many striking illustrations.

**A Spanish Hill-climb.**

The Barcelona Motor Club held a hill-climb recently, the length of the hill being seven miles. The winner of the 550 c.c. sidecar class was mounted on a 4 h.p. Triumph outfit, and second and third places were also secured by riders mounted on machines of this make. The winner lowered the record for the hill.

**Recreative Motor Cycling.**

The dry roads and sunny sky tempted many motor cyclists out last week-end. War badges were conspicuous, and we have no doubt that, refreshed by the week-end jaunt, many a hard worker returned to work on Monday morning with renewed vigour.

**The Improvement of Hubs.**

The article on hubs in the last issue of *The Motor Cycle* has aroused great interest both among private users and manufacturers. Butterfields, Ltd., makers of the Levis, consider that the article, besides interesting readers, will have the effect of livening up manufacturers and showing them that an interest is being taken in their productions in detail. This is just what we intended.

**Motor Cycling in a Blizzard.**

A member of the staff attempted an eight-mile ride on the night of March 27th, mounted on a "baby" two-stroke, and accompanied by a friend on a 3½ h.p. twin. The journey was started at 10.30 p.m. Twelve o'clock found them both stranded four miles from home, soaked through, half frozen, and both machines refusing to move, owing to water and snow having caused the magnetos to be "too proud to spark." After a mile push through the blinding snow to the nearest village the owner of a cottage, which was the only one from which an answer could be obtained, refused shelter or assistance, and had it not been for a really sporting car owner, who was proceeding along the road and conveyed the unfortunates home, their position would undoubtedly have been unpleasant in the extreme. The good Samaritan turned out to be none other than Mr. Harry Smith, the well-known managing director of the Rover Co.

**THE BUDGET.**

On Tuesday, in Parliament, the Chancellor of the Exchequer outlined his Budget proposals. The new taxes on motor cycles are appended:

Motor cycles not exceeding 4 h.p. = £2 2 0  
Over 4 h.p. three quarters of the duty chargeable on motor cars.

Examples:

A motor bicycle of over 80 mm. bore is over 4 h.p. 81 mm. on the Treasury formula=4'67.	Tax	£3 3 0
Twin-cylinder machines from 57 mm. to 72 mm. bore.	Tax	£3 3 0
Twin-cylinder from 73 mm. to 98 mm. bore	Tax	£4 14 6

**New Identification Letters.**

The County of London now has another identification mark, the latest being L.R. Under the Motor Car Act of 1903 London had A allotted to it. Since then the following have been added from time to time: L.A, L.B, L.C, L.D, L.E, L.F, L.H, L.K, L.L, L.M, L.N, L.O, L.P, and L.R. Southampton now has a second index mark—H.O. The first one is A.A.

**Rejected Motor Cycle Experts.**

For some time past able-bodied men have been retained from service in the Army to test motor cycles for the different manufacturers, whereas, many men incapable of army work are quite well fitted for this task, not to speak of men over military age. We are not surprised to hear that certain manufacturers are now taking steps to release single men who have held badges up to the present, and one firm has asked us to refer to it any motor cycle testers who have been rejected for army service, with a view to finding positions for them.

**Blackpool Motor Volunteers.**

One night last week the Blackpool Motor Volunteers had a test call to convey 100 troops to outposts in the neighbourhood. The men were placed in cars, and the convoy was escorted by motor cyclists, the whole affair being carried out in a satisfactory manner.

**Motor Cycles in Lieu of Telephones.**

In many districts the telephone wires are still out of order, and telegraphic communication is also in many cases as often as not impossible owing to so many of the wires being down as a result of the terrific gale and snowstorm last week. In several towns the police have made use of motor cyclists to carry special messages.

**British Made—Foreign Design.**

Already, the prohibition of imports of motor cycles and accessories has led to enquiries being made in this country on the question of manufacturing foreign designs in British factories. It will cause no surprise to see announcements in the near future of manufacturing arrangements for the more popular machines having been completed.

**"The Motor Cycle" Formula.**

It was in the spring of 1911 that the formula question was discussed in our pages, the old A.C.U. formula being generally considered out of date. The

first club to use the formula  $\frac{C \times T^2}{W}$

was the Lincolnshire A.C. (Motor Cycle Section) at the Grimsthorpe Park speed trials in May, 1911, though the Streatham M.C.C. considers it was first in September of that year. Just how *The Motor Cycle* were led to adopt and popularise the time squared formula will be related in an early issue.

A FRENCH MILITARY SIDECARRIER.

Our gallant Allies make extensive use of this type of vehicle for many purposes. The photograph was taken recently on one of the snow-covered roads in the Argonne, and the bicycle is a Triumph.

Triumph mounted French despatch riders attached to a heavy artillery section. Two of the machines, it will be noted, have side-carriers attached.

## SEMI-T.T. BARS FOR MILITARY MOUNTS.

IT will be fresh in the minds of our readers that despatch riders in the different war zones have frequently complained of the type of handle-bars sent out to them for use over roads differing very widely from even the worst that Great Britain can provide. Upswept touring bars for such conditions are most unsuitable, and it has been no uncommon thing for the more practical riders to improvise a semi-T.T. bar from the touring type handle-bar to enable them to hold their machines up better in grease.

We have referred to the subject on several different occasions during the twenty months of war, and now a new type handle-bar has been standardised by the Triumph Cycle Co., Ltd., for military mounts, which is illustrated. These machines will not find their way out to the Front immediately, but our readers in the different war zones will be pleased to note the change. We have tried a 4 h.p. Triumph with the new handle-bar fitted (which, by the way, measures no less than 36in. across the grips); and it provides a wonderful

degree of control, with a semi-crouching position which is very comfortable on a long ride.

It is the more surprising that the change has been so long coming, as just before the war this type of handle-bar had really "caught on" among the sporting class of motor cyclists, and was regularly to be found on so-called standard touring machines in the different trials. We venture to think that its uses will extend on touring machines after the war, more especially when the mount is required for fast work.

Latest model W.D. Triumph showing new handle-bars.

## MOTOR CYCLE UNION OF IRELAND.

ON Monday of last week the annual general meeting of the Southern Centre of the Motor Cycle Union of Ireland was held at Jury's Hotel, Dublin.

Mr. T. J. Dumphy, the retiring chairman, presided, and moved the adoption of the report and balance sheet presented by the hon. secretary and treasurer, Mr. A. W. Mooney. The finances of the centre were in a very satisfactory state, and the balance in hand permitted the meeting to vote to each of the affiliated clubs a donation

that exceeded their affiliation fees. Mr. T. W. Murphy was elected president for the year, and Mr. A. W. Mooney was re-elected hon. secretary and treasurer.

The only matter of interest that came before the meeting under the heading of general business was the question of the government of cycle car competitions. The present state of public affairs has resulted in the negotiations between the Union and the Irish Automobile Club not being hurried along. The delegates who met the Club on the subject re-

ported that the definition of a cycle car that was agreed to limited the engine capacity to 1,100 c.c., and the weight to 7 cwt. unladen, vehicles coming under this definition to be regarded as being within the sphere of influence of the Motor Cycle Union.

The meeting decided to send forward the draft agreement to the conference with the Ulster Centre, with a suggestion that an effort should be made to get the Irish Automobile Club to agree to an increase in the weight limit, and so to include light cars.

## NAVAL AND MILITARY NOTES.

## THE RESULT OF A FALL.

WE are sorry to hear that Cpl. John C. Coney, a despatch rider with the Salonika forces, from whom we received photographs and news which were published in our issue of March 2nd, is at present in hospital with a fractured skull, the result of a spill. The latest information, however, is that Coney is making good progress.

## VARIED MILITARY EXPERIENCES.

WE were pleased to receive a few days ago a letter from Reg. Samson, whose name will be familiar to many readers, as he was an active rider, and before the war carried on business in Birmingham. Upon the outbreak of war Samson closed down his works and joined the Royal Warwicks, with which regiment he stayed until December, 1914, when he joined the Motor Machine Gun Section. Motor cycle repairers, however, being required in the A.S.C., he was again transferred. Then he took up lorry driving, and last October saw him driving a 3 ton Daimler in Egypt. He is now at Salonika, where there is a deal of heavy transport work to be done, but the lorries stand up well, considering the atrocious roads. Samson confirms information we have already received, viz., that the motor

cycles are doing well under difficult circumstances. Douglasses, Triumphs, and B.S.A.'s are the chief mounts.

## MOTOR CYCLIST AIRMEN.

R. HOLLOWAY, the one-time well-known Premier rider, is now in the Royal Flying Corps, and a brother officer of O. C. Godfrey, the Indian expert. Among the naval promotions we notice under the heading, Royal Naval Air Service, Flight Sub-Lt. J. Forgan-Potts to be Flight Lieutenant, and Temporary Flight Sub-Lt. P. C. D. Douglass to be Temporary Flight Lieutenant.

Forgan-Potts is a motor cyclist of long experience and of no inconsiderable skill. When racing was at its height he was a familiar figure at Brooklands, and usually rode a fast Indian. P. C. D. Douglass is a member of the Public Schools M.C.C. His story is an interesting one. When war broke out he was in hospital suffering from the effects of an accident, met with while riding a motor bicycle bearing the same name as his own, which severely damaged his leg. Getting well was a tedious matter for such an ardent patriot who was fretting to go for the wily Hun. But once out of hospital Douglass sought the nearest Army doctor. He was lame as

## WITH OUR DESPATCH RIDERS IN FRANCE.

(Circle) The morning shave in comfortable billets.

(Above) Heavy going during recent snow.

(Left) Douglas mounted despatch rider in winter garb.

the result of his accident, so he rolled into the room with his hands in his pockets and an "own the earth" sort of look on his face, hoping thus to hide the limp. "Strip," said the doctor. He quickly stripped to the waist, and showed an expanse of manly chest, which no doubt completely satisfied the medical man. "Now kindly remove your nether garments." The sound leg was taken out and the other left covered. "Please take them right off. H'm. That's a nasty scar. Now stand on tip-toe, place the hands upon the hips and sit down with the knees extended." Poor Douglass's knees assumed an angle of 60° and refused to obey further orders. "Thank you," said the medico, "I am afraid I cannot pass you." He then spent all his available cash upon a first-class, but expensive, car, attached himself to the R.A.C., and spent a happy six months driving military gentlemen whose hats were adorned with red and brass. Then Time, the great healer, did his duty, and Douglass became a sailor. We wish him all good luck and congratulations on his promotion.

## SALONIKA ROADS IMPROVING THANKS TO ALLIED EFFORTS.

ACCORDING to a letter recently received from an officer at Salonika, the roads in that region are improving, thanks to the efforts of the British and French authorities, who have had the assistance of hundreds of Greeks on new road construction. Perhaps we may yet see motor cycles rendered popular in Greece after the war! Our correspondent writes: "The roads here are quite good now, if a trifle bumpy, and I have had a trip or two on borrowed Douglasses, out to the Varda to see the French trenches and wire. Horses and mules are our chief care, but buffaloes and donkeys are also included at times. I, of course, left my mount—a 3½ h.p. Arno—at home, and it is doing good work in Devonshire with my sister in charge."

# SATISFACTORY PUNCTURE REPAIRS.

## Description of the Working of the Mustikon System.

**W**E have on more than one occasion referred to the Mustikon repair outfit, but it has aroused such interest that a description of the method of working will not be out of place. The Mustikon patch is a stud with a large head, made of the finest rubber. The top portion is cup-shaped, and in this lies one of the greatest advantages of the device, as when the cup portion is pressed down it forces up the inner portion and air locks the patch on securely.

### The Method Described.

In the case of a nail cut the method of procedure is as follows: The tube is folded over, and the corner of the fold where the puncture is is nipped up and cut with a pair of scissors. In the case of the outfit for lightweight machines, instead of a pair of scissors a punch is applied. We now have a small round hole about the diameter of a large French nail. The patch is then nipped by means of a special pair of pliers in the manner shown. It is in the manipulation of the next process that a little skill is required. First of all the patch is dipped in the solution, which also acts as a lubricant. The piece of tube just in front of the hole is pinched between the finger and thumb of the left hand, and the wrist is rested at a convenient

distance from the hole on the other portion of the inner tube. The device is then forcibly pushed into the hole, and a firm hold is kept at the same time upon the pliers. When the whole patch has entered the tube it is drawn backwards and then pulled forward, so that the whole of the upper portion of the patch can be lifted outside. The repair outfit can then be packed up, and by the time this is completed the outer portion of the patch can be pressed down and will adhere to the tube. Care must be taken not to allow wet solution to adhere to the pliers, or they will not grip the patch sufficiently hard.

It will be noticed that nothing is mentioned in the foregoing about cleaning the tube, as this is not neces-

sary; in fact, the patch would be almost airtight without any solution at all, owing to its locking action.

Mustikon patches are supplied in all sizes, even up to 2 in., but these latter are treated in rather a different manner. In the event of a nip the procedure is to wet the rubber template at the bottom of the patch and press this over the slit. A dark mark will then appear on the tube, which will allow the rider to see the exact amount of tube to be cut. The tube is then cut round the edges of the dark mark, and the same procedure is followed as in the case of a puncture, only in this case it is advisable to prepare the tube in the ordinary

way by rubbing it down with sandpaper and spreading a little solution round the edge. Care, of course, must be taken not to insert the patch upside down. The right way up is clearly seen, as the inner edge of the upper portion has a specially prepared surface, and the number denoting the size of the patch is clearly marked thereon. It has been said that three hands are needed to insert the patch into the tube, but we can assure our readers that this is not so if a little care and intelligence be employed.

Various stages of an inner tube repair by the Mustikon process.

(1) Folding the tube and cutting the corner so as to convert a pinhole puncture into a round hole. (2) The special punch supplied with the lightweight outfit. (3) Showing the manner of gripping the patch prior to insertion in the tube. (4) The position assumed by the patch before the top portion has been pressed down. (5) Sectional view showing the repair complete. (6) Method of treating a burst or nip. The shaded portion on the cover is marked by wetting the template; the edges of the mark must be cut round with scissors. (7) Mustikon coat hanger.

### A Complete Repair Kit.

The Mustikon outfit consists of patches, a pair of pliers, a pair of scissors, a small roll of

insulated tape, two sparking plug washers, some French chalk, a piece of copper wire, eight valve tubes, a tin of solution, and last, but not least, a most ingenious little accessory in the form of a coat-hanger. In the case of a repair on a hot day the rider often wishes to take off his coat. If he flings it over the machine, as likely as not it will become oily; if he leaves it on the ground, it will become dusty; but if a gate or tree is handy he may push the pin of the Mustikon coat-hanger into the gate post or tree trunk, and hang not only his coat but his cap securely thereon. The little coat-hanger is a wonderfully neat contrivance, is about 2 in. in length, and folds up.

THE  
**MOTORCYCLE**

**Annual Spring Number.**

An Enlarged Issue with  
Special Illustrations.

# ROYAL RUBY NEW MODELS.

J.A.P. Engines. Jardine Four-speed Gears, with Duplicate Hand and Foot Controlled Clutch.

EXAMPLES OF TWIN-CYLINDER ROYAL RUBY MODELS.

**T**HOUGH we have already briefly enumerated some of the chief improvements in Royal Ruby heavyweight models for 1916, we have not as yet fully described the practical features of these substantially constructed machines. In spite of the many difficulties of manufacture, the general order of "no change" by no means applies to the Royal Ruby models, and it will be seen from our illustrations that these machines have been redesigned throughout, and present an attractive and thoroughly well finished appearance.

As regards alteration in the framework, three of the main frame lugs are now designed to take the sidecar attachments, the fourth connection being brazed to the chain stay, so that a thoroughly rigid four-point attachment is provided. Other important frame alterations are described later, and this year all heavyweight models are fitted with the Jardine four-speed gear box, the drive being by enclosed chain to the countershaft and belt to the rear wheel. J.A.P. engines are used throughout, and duplicate control is provided for the clutch.

## Accessibility and Strength of Frame Design.

In an accompanying illustration the rear mudguard and carrier are shown removed as one unit, this being effected by the undoing of four bolts. The carrier is of exceptional strength, and its design is particularly adaptable for the securing of tool cases, pump, and number plate. A commendable feature in the design of the mudguard is the

provision of an inside channel, which effectively prevents mud and water dripping on to the belt, which should thus prove less susceptible to slip in bad weather.

Note also the additional support from the saddle tube to the fork of the rear stays. This relieves the saddle stays of practically all strain, and they can be entirely removed in unit with the carrier without upsetting the rigidity of the frame.

On the twin-cylinder models a well-balanced arrangement for lifting the exhaust valve tappets is arrived at by means of a spring loaded box, and pivots of ample leverage. The tank is supported from below, and is insulated from the frame by means of rubber pads.

An ingenious arrangement, to which we have previously referred, is resorted to for adjusting the height and angle of the aluminium foot plates. The principle is shown in one of our illustrations, and it will be seen that by loosening one nut the plates can be swung into any position within their range of movement.

A hand lever on the tank and a pedal to the right foot of the rider are interconnected for clutch control. This should add much to the ease of traffic riding.

The rear forks have been re-designed to accommodate the Jardine gear, and are very strongly made, being of sufficient width to permit the use of an exceptionally wide mudguard. The massive lug at the bottom of the seat tube affords a facing for the engine

cradle plates, and through it also passes the bolt supporting the chain stays, which can be removed in unit with the gear box. Thus, while affording a high degree of accessibility, the rear portion

Interconnection of foot and hand control for the Royal Ruby clutch.

of the machine is designed with due consideration for the great strains it has to bear.

## Available Models.

The heavyweight models comprise— $3\frac{1}{2}$  h.p. single-cylinder (£72), 3-4 h.p. twin (£80), and 5 h.p. twin (£85), all with Jardine four-speed countershaft gear, single cork inset clutch, aluminium chain cover, and 1in. belt. The 6-8 h.p. models (£87) are provided with a double cork clutch and  $1\frac{1}{2}$ in. belt.

Having an extensive Colonial market, Messrs. Royal Ruby have seriously tried to meet the demands of the practical rider; but with regard to Colonial demands, we are constrained to criticise one comparatively insignificant point—the arrangement of the exhaust extension. We are apt to think the Colonial rider would find this rather a nuisance, and likely to act as a sprag when wheeling the machine backwards over rough ground. A neater arrangement, less likely to disturb dust or catch the ground, might easily be arrived at by employing an oval pipe, carried straight back from the silencer base.

A specimen of the  $3\frac{1}{2}$  h.p. single-cylinder Royal Ruby.

# ANNUAL MEETING of the A.C.U.

Report of the Proceedings at the Royal Automobile Club on Thursday last.

THE annual general meeting of the A.C.U. was held on Thursday of last week at 6.30 p.m.

Mr. Otto Thomas, chairman of the General Committee, was in the chair, supported by Mr. J. R. Nisbet and Mr. G. F. Sharp, vice-presidents of the Union, Mr. H. P. E. Harding, vice-chairman, and Mr. A. W. Torkington, honorary treasurer. There was present a number of members of the General Committee, and a few members of the Union.

The minutes of the last general meeting, having been confirmed, the Hon. Arthur Stanley, M.V.O., M.P., was unanimously re-elected president for the ensuing year. The vice-presidents for the past year:

Professor C. V. Boys, F.R.S.,  
Mr. S. F. Edge,  
Col. Sir H. C. L. Holden, K.C.B.,  
Marquis de Mousilly St. Mars,  
Mr. J. R. Nisbet,  
Lt.-Col. Mervyn O'Gorman, C.B.,  
Mr. G. F. Sharp,  
Mr. Robert Todd,  
Mr. A. J. Wilson,  
were all unanimously re-elected.

The Chairman then presented the report of the committee for the past year as printed. He drew attention to the excellent work undertaken by the Union in recruiting motor cyclists for the Royal Engineers, and laid emphasis on the importance of the work to be undertaken by the Central Committee for the Employment of Discharged Soldiers and Sailors connected with the motor industry. He expressed the hope that through the association of the Union with this committee no motor cyclist who had served his country ashore or afloat during the present war should lack subsequent employment.

The Hon. Treasurer then presented the balance-sheet for the twelve months ended December 31st, 1915. He drew attention to the fact that, although during the past year the Union had suc-

ceeded in paying its way, and was in a better position financially than twelve months ago, there was still a deficit on the revenue account, and until this was wiped off it was deemed inadvisable to depreciate the items standing in the balance-sheet under the headings Furniture and Preliminary Expenses. The balance-sheet was adversely criticised by one member. Mr. J. R. Nisbet complimented the committee on the production of such an excellent balance-sheet during times of exceptional difficulty for such an organisation as the Auto Cycle Union. In reply to the criticisms, the Hon. Treasurer explained that investments were entered at cost, and that the increase in the value of stock was accounted for by the cost of a large

Royal Ruby rear wheel mudguard and carrier detached in one unit, the guard is provided with an internal channel, which prevents water from dripping on the belt (see page 327).

number of hotel plaques which had been ordered before the war, but were not paid for until last year.

The Chairman then stated that as no formal notice of resolutions had been received, the business of the meeting was concluded, but that he was prepared to hear any expressions of opinion from members. An informal discussion then ensued.

Scene : Any main road in the greater part of England after last week's blizzard.

## Average Prices OF Second-hand Machines.

# "THE MOTOR CYCLE" RECRUITING SECTION.

## Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

## Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

**A**MONG last week's recruits for the Motor Machine Gun Service were a good many pairs and trios—chums who had decided to enlist together. In most cases it can be arranged to allot such men to the same battery.

Vacancies still exist, and experienced motor cyclists of good physique who conform to the requirements should fill up the special form or attend one of the inspections arranged.

This week's inspections were at Coventry on Tuesday, Nottingham on Wednesday, whilst on Saturday afternoon the Editor, Mr. Geoffrey Smith, will be at *The Motor Cycle* offices, 20, Tudor Street, E.C., to test candidates from London and environments. War Office acceptances will be issued to suitable applicants as usual. Motor cyclists in London and district, who have applied for enlistment stating their experience, have been notified to attend.

The object of arranging the inspections in different parts of the country is for the convenience of recruits and at the request of the War Office. A good number of men of the M.M.G.S. having come from the West Country, it is hoped to arrange a date for Bristol in the near future. A further announcement will be made on this page in a later issue.

8,092 is the total number of applications from motor cyclist recruits dealt with by Mr. Geoffrey Smith since the outbreak of war. Many letters of appreciation have been received from the authorities, as well as recruits who have been placed in the section they desired.

The terms of enlistment in the M.M.G.S. are:

Pay, 1s. 2½d. per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limits, 19 to 40.

Among recent batches of recruits were a number of single men who have only recently been released from Government controlled establishments. It is only fair to say that a number tried to obtain permission to enlist several months ago.

## AN OUTER POST OF THE EMPIRE.

**S**INCE the war began the pages of *The Motor Cycle* have borne witness to the good work in the great cause accomplished by motor cyclists throughout the Empire. Naturally, most has been heard of men in the Army, but it must not be forgotten that many motor cyclists debarred from actual military service have volunteered for other duties, such as special constabulary, Red Cross work, National Volunteers, and a hundred and one other jobs where more fit men could be released for the regular Army and Navy.

In the latter category would be placed the three Hong Kong motor cyclists who are shown in the accompanying illustration. These men are the first members of the special police reserve, motor cycle patrol section, of that distant part of the British Empire. They have offered their services with motor cycles, the running expenses of which they bear themselves.

The Hong Kong "specials" number about 500, and include companies of English, Chinese, Portuguese, and Indians, together with a mounted section, ambulance section, and machine gun section. The duties of the mobile squad illustrated consist of night rides along deserted roads to neighbouring villages, calling at wayside police stations, etc.

Members of the Hong Kong Special Police Reserve, Motor Cycle Patrol Section. Names from left to right: P.C. Tennant (1915 Triumph), Staff-Inspector J. Clark (1914 Triumph), and P.C. Charles W. Randall (1915 Pope). The two latter have been transferred from the Hong Kong Volunteer Corps Civil Service Co.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

#### A Board of Selection.

Sir,—As a D.R., at present in action, who (thankfully) rides one of those machines which give "universal satisfaction," I would like to say a word or two in reply to Capt. Lindsay. Yes, if he looks at my front forks he will find the regulation leather strap. There are seventeen "universal satisfactions" in our unit, and they have all weathered this last winter without trouble (barring accidents). The reason for this tethering is in no way to provide a rigid fork, as the spring is allowed full play, but to fix a maximum limit of rebound for the spring, and if it is broken (due to any abnormal strain) to ensure the safety of the D.R.

We have numerous pot and shell-holes round here, and but for this type of front springing I venture to think that I should not now be using my original front forks. The only time this design makes a machine unroadworthy is at speed—say 45 m.p.h. and over.

A Board of Selection, which *The Motor Cycle* has suggested, undoubtedly would be a good thing, but, if formed as Capt. Lindsay mentions, I am inclined to the opinion that this type of springing would exclude all others.

HUGH D. SHAW, Cpl. R.E.

#### Top Feed Carburetters.

Sir,—The prejudice that your contributor "Ixion" says exists against top feed carburetters is inexplicable to me. Take the four points raised in his note under this head in your issue of March 30th—

*Inaccessibility.*—The operations to remove, say, the float or needle valve, for inspection in a top feed chamber are:

1. Get two spanners out.
2. Unscrew and detach petrol pipe union.
3. Unscrew float chamber cap.
4. Withdraw needle or float.

Against, in the case of a bottom feed chamber (inverted needle valve, as used by Senspray and Amac):

1. Get spanner out.
2. Unscrew float chamber cap.
3. Unscrew and detach petrol pipe union.
4. Detach needle valve clip or split cotter.
5. Withdraw needle or float.

When replacing, the top feed type has (for the novice) the enormous advantage that, as there is no need to disturb the needle valve clip or cotter at all, there is no danger of the rider forgetting to replace it correctly in its proper position when reassembling, as has often been done in instances that have come under my notice. Failure in this respect results either in the level being lowered, or, as more often occurs, being raised considerably, which is bound to produce flooding, with consequent heavy consumption, overheating, or, as some prefer to say, "over eating" (of petrol, presumably), starting difficulty, etc. In the case of the B. and B. type chamber the number of working parts (some people call them "working loose" parts) is considerably reduced in the top feed type, which cannot but be considered an improvement.

*Constant Choking of Filter Cause.*—This trouble does not apply any more to the top than to the bottom feed type. It can be cured in both cases by the simple expedient of removing the gauze altogether, as is generally done. If done, the balance is still in favour of the top feed type for the following reasons: If any grit or dirt comes through the petrol pipe it is, in the top feed type, washed right through

into the float chamber, and ultimately comes to rest in the sump or well made at the bottom of the float chamber—the petrol exit to the jet being some little distance up the side of the chamber—quite removed from the needle valve point and seating which are constantly washed clean by the incoming petrol, for the valve closes *against* the stream, and this again prevents, to a very large extent, the wear of the valve and seating, and results in much longer life, and, consequently, it is much longer before flooding.

In the bottom feed type the dirt is constantly settling down round the seating, and as the face of the valve is not washed to anything like the same extent, as the valve closes *with* the stream, any particle of 'grit' is more apt to get wedged between the valve and its seating than in the case of the top feed instrument.

*Absence of any Provision for Lowering Petrol Level.*—There is no difference in this respect between the two types. The collar, spring clip, or split cotter, or whatever arrangement is used to fix the level at the correct height, can still be "toyed" with in the same way, with either top, or bottom feed.

*Liability of Float Chamber Lid to Turn, etc.*—It is more than probable that this will occur, and nobody with the least gumption would attempt to unscrew the petrol pipe union nut without holding the float chamber cap with a spanner; but against this the rider has the satisfaction of knowing that he cannot lose his float chamber cap through his not having screwed it up tightly before starting, and would not be losing petrol through failure to make the joint between the cap and chamber edge properly. The snap-on type of cap, to which "Ixion" apparently so fondly clings, is, fortunately for present-day riders, a thing of the past, never, it is hoped, to be resurrected.

In conclusion, it may be hardly necessary to point out that "top feed" is not a new idea at all, as some would think, but appears to be another instance of the survival of the fittest, and, like the rise in income tax and other good things, has come back to stop.

TOP FEED.

Sir,—*Re "Occasional Comments"* and top feed carburetters, I think a consensus of riders' opinions would condemn this abomination with no uncertain voice. The first (and only) fifty miles of one of my machines with this fitment was marred by repeated stoppages to clear odd *débris* from the effective (?) filter of about 10 square millimetres area.

Since fitting a sensibly designed three-jet instrument, I have not had occasion to touch the carburetter in close on 1,000 miles.

ALEX LINDSAY (CAPT. R.A.M.C.).

#### Derby Groups and the M.T., A.S.C.

Sir,—*Re "Group 40's"* opinion on M.T., A.S.C., pay for Derby Groups, etc., I beg to state if our worthy friend had come up sooner, no doubt he would have received the 6s. per day; but I expect he was like a good many more men, wishing to do their share by having the plums in private jobs, while married men like myself with children gave up good jobs and came forward when the country wanted men. We shall have the conscripts next expecting high rate of pay for willingly doing their share.

EX-SOUTH AFRICAN VOLUNTEER.

Sir,—I am getting rather tired of the sort of chat written by "Group 40" in your issue of March 23rd, and there are many others here who think with me. I consider it was a

mistake ever giving the M.T., A.S.C., men six shillings a day at all. Why should the best jobs be the best paid? I should say that only about 10% M.T. men run any risk at all worth considering. Of course there was more danger at the beginning of the war. One hears much too much of the "willing to do one's bit" talk. After all, the war is not going to be won by men driving motors. The poor old infantryman on a bob a day is the man who has to do the dirty work, and I know numbers of old married men in the ranks who genuinely "do their bit" in mud and slush on a shilling a day. There is one old man I know here who was met the other day in the trenches by the General. "Why were you not in the Boer War?" said he. "Because I was too old," replied the hoary old veteran.

SUBALTERN.

### Carbonisation.

Sir,—The letter of V. Olsson in *The Motor Cycle* for March 23rd reminds me of a resolve I made recently to communicate my experience on this important item in motor cycling. Whilst always enjoying the articles of "Ixon," I must disagree with him on the necessity of dismantling the engine after 1,000 miles or so. A  $3\frac{1}{2}$  h.p. New Hudson with heavy sidecar which I own has given no running sign of carbon deposit at the end of 1,000, or even 3,000 miles. Thinking it must be necessary, I took down the engine recently to make a thorough overhaul. Remembering "Ixon's" remarks, I was surprised to find only the smallest trace of carbon deposit—so little, in fact, that there was no necessity to use a scraper—and the piston rings were quite free. I attribute this condition to two factors—

(1.) The use of good air-cooled engine oil with natural graphite (not Oildag, which is artificial) permanently suspended therein. This being a vastly better lubricant than ordinary oil, much less can be used than is generally recommended, and my consumption is less than one-third. Result, a cooler engine and so much less oil to carbonise.

(2.) The adoption of a Binks three-jet carburetter having an auxiliary air supply, which on most hills can be used as an air brake and engine scavenger with the throttle shut.

A natural result of these two factors is a wonderful improvement in petrol consumption, which by my friends is considered phenomenal. It works out at 95 m.p.g. amongst the hills of Derbyshire.

The above oil is made up by a Glasgow firm, who, I believe, has been very successful with this method of lubrication for all types of machinery.

J.P.S.

### A Two-stroke after 1,000 Miles.

Sir,—Perhaps my experience would interest some of your readers if you think it worth inserting.

My machine is a  $2\frac{1}{2}$  h.p. two-stroke, two-speed Chater-Lea, Villiers engine. I have ridden almost 8,000 miles up to the present. (I mix lubricating oil and petrol one to sixteen.) I have had the cylinder off—first time after 1,700 miles, second time after 951 miles, third time after 2,000 miles, and fourth time after 2,508 miles. Of the last 2,508 miles 508 were run on a mixture of half petrol (No. 2 Pratt's) and half petroleum (or paraffin), cheapest grade, which I am now using constantly, and intend to continue, as the engine seems to pull better on it.

I have not had any new piston rings as yet, and on each occasion on which I had the cylinder off I found the amount of carbon deposit very trifling, and distributed much as in your sketch—very little in the cylinder head, scarcely noticeable on top of the piston, and most where the gas and oil come in from the transfer passage and strike the piston. The total amount of carbon which I was able to scrape off the cylinder and piston just covered a penny to about one-sixteenth of an inch in depth, and that after 500 miles of half petroleum mixture. Inside the piston on each occasion on which I removed it was about a teaspoonful of a cinder of charred oil.

My piston has three rings—one each at top, bottom, and middle. The top one was slightly stuck at the exhaust port side for about an inch, but easily removed, and the others quite free. I would not have removed the cylinder this last time as the engine had been going exceedingly well, but when I was finishing up a forty-four-mile ride one morning the engine suddenly lost power as if the magneto spark had been retarded, and I did not find out what was wrong until I had the cylinder off, and replaced again, and had tried

everything I could think of, and at last I found that the magneto sprocket had slipped round about  $\frac{1}{2}$  in. on the armature axle. On setting this right there was no more trouble, and the engine pulled as before.

When using all petrol I could always start within a yard, sitting on the saddle, engine cold, and carburetter flooded, on low gear. I can do the same with the petrol-petroleum mixture if the engine is hot, but if cold I have to inject petrol into the top of the cylinder and it then starts easily enough.

My average riding speed is about 25 m.p.h. on the regular run which I have to take winter and summer, and I have worn out two belts, one chain, one engine sprocket, one V belt pulley on the two-speed gear, two back covers (2in. and  $2\frac{1}{2}$ in.), and one front cover. Of course, I keep the machine in good order, and mix carefully the oil, petrol, and petroleum.

The worst things I find about all machines for winter riding are the totally inadequate mudguards. I had to make special mudguards for myself—the back one 9in. wide and the front from 10in. at the number plate to 18in. when near the ground, and I can now ride in any weather, and come back without any mud on my overalls.

J.B.

### Mudguarding.

Sir,—I really think that some of us who use our motor cycles in winter have a legitimate grievance against the manufacturers in the matter of mudguards. I have a  $2\frac{1}{2}$  h.p. two-stroke machine, which in every other way is a marvel of efficiency. But on a wet road it throws up a continuous stream of mud, which covers my legs high up above the knee, the engine, the belt, and eventually most parts of the machine. I wrote to the makers, but only got the cold comfort of a recommendation to have a shield made by any intelligent mechanic. So I could: but the thing would be an obvious addition; it would not be finished like the rest of the cycle, and shortly it would rattle. It would really seem as if the makers only intended to turn out a fine weather machine. They seem to consider every part of the outfit except the rider. All that is wanted is two or three small lugs on the frame, a piece of bent sheet metal, and some fittings, the whole to be properly enamelled and fixed. If the makers only knew the amount of uncompensated comment that goes on amongst riders I am sure they would remedy this. Many a man who sees how my motor cycle goes says, "I would buy a machine like that to-morrow if only the mud could be kept off me." When I explain that the makers resolutely refuse to fit a shield, he goes and gets a Model W Douglas.

A.A.

### Lighting Tips.

Sir,—In your issue of March 9th "H.A.B." contributed an article on the disadvantage of too much tubing. His experience was that the slight pressure he was able to obtain at the rear was insufficient to keep the light in during windy weather or on rough roads. He definitely put the trouble down to the long length of tubing from the front generator. As one who has had a good deal of trouble, may I suggest that his conclusion is not quite correct? The front lamp usually has a burner of 14 litres, and the rear  $3\frac{1}{2}$  litres. Whatever pressure is given off by the generator the rear lamp only gets its proportion. Before the lighting restrictions the  $3\frac{1}{2}$  litres burner kept in very well, but now, with the necessity of diminishing the head light by about half, the rear light is similarly reduced, so it is obvious half-pressure through such a small burner is easily extinguished. I solved the difficulty by substituting a  $10\frac{1}{2}$  litres burner in place of the  $3\frac{1}{2}$  at the rear, and now get a splendid light. I must say that this burner is a little too large, and one about 7 litres would probably be sufficient. The 14 litres head light would then be twice as bright as the rear light. I did not find the length of tubing to touch the difficulty, and this can readily be proved by disconnecting the tube at the rear and fixing the generator to it. By lighting the head light it will be found to give the same size flame as if connected by a short tube. A larger burner at the rear is more satisfactory, as it means one generator less to clean and fill, and, in addition, one is able to be more economical with the carbide, by being able to reduce the pressure on both lamps, with the certainty of the rear light not failing.

C.A.L.

# SPRING FRAME DESIGN.

Latest Efforts to Increase Riding Comfort.

**T**HE MOTOR CYCLE campaign in favour of rear springing continues to produce designs of varying merit, and soon after the much-desired peace arrives motor cyclists should have the choice of many excellent examples. We are glad to notice that several of the larger and better known manufacturers are now turning their attention to this important part of motor cycle design. The need for spring frames is every day more felt even in this country, owing to the deteriorated state of the roads through lack of labour and war traffic, while in a number of the Overseas dominions the want is even greater.

## The Douglas Cantilever Fork.

We have already illustrated and commented upon the Douglas rear springing arrangement, and now publish an illustration of a novel fork patented by the same company. This novel construction comprises a main rigid fork A attached to the steering head and swivelling therewith. The wheel is carried in

Douglas spring frame fork on the cantilever principle.

a subsidiary fork B, the upper end of which is pivoted to a link C, whilst at the lower end it has attached to it one end of a laminated cantilever spring D, the fulcrum and other end of which are attached to the main fork A. The construction is very interesting, but it should be understood that, although the device has been patented, we are not aware that it is the intention to place the fork on the market.

The James spring frame, which consists of grasshopper springs giving a parallel movement.

## Design by a Scotch Engineer.

The next illustration shows a spring frame which is the invention of Mr. G. Murray. The springs, of the laminated variety, are carried by a cradle which extends below the engine. The rear stays, which are bent to the correct radius, slide in sockets below the saddle, and thus prevent any lateral movement of the rear wheel. Torque rods extend from the countershaft gear box to the rear axle. We understand that a pedal cycle has been built on this principle, with satisfactory results.

## The Blanchard Spring Frame.

This is an extremely simple construction. Here the wheel, stand, and carrier are mounted at the end of a girder-like rear fork A. This is pivoted at B, and is extended beyond the pivot as shown at C to engage springs D carried by the

The Blanchard spring frame.

rigid frame E. It will be seen that this is an adaptation of a spring fork of the Triumph type for carrying the rear wheel. The elements employed are exactly the same, and only one pivoted joint is required.

## The James Rear Springing.

As in the Douglas spring frame, cantilever springs are used, located in the

An original design by a Scotch engineer, George Murray.

same position as on the Douglas, but in this case the spring extends further forward, and is attached to a pin A, which may be specially constructed to serve for the attachment of a sidecar. Instead of the rear parts of the springs forming distance rods between the vertical fork B, the special links C are used, and are practically parallel with the pivoted chain stays D, so that the fork B rises and falls in parallel lines. The links C are extended at E, and these extensions carry the centre of the cantilever springs. The centres are bolted to a platform F, which presumably is free to pivot.

## A NEW BELT FASTENER.

**W**E have received a new and well-made belt fastener from the Hexham Motor Co., Hexham. The makers claim for it several advantages. There are two arms to take the pulling strain instead of one; consequently it has two pulling surfaces to take the wear, and this is bound to prolong its life. The ends of the belt are brought to within half an inch of each other, and

The Hexham belt fastener.

consequently these do not wear out readily. It is easy to disconnect, and, moreover, possesses the advantage of consisting of only four separate pieces, including the screws. The fastener passes over the pulley without noise, and is only 2½ in. long.

## "THE MOTOR CYCLE" IN CAIRO.

**F**OR the information of our many Service readers now in Egypt, it may be mentioned that *The Motor Cycle* may be obtained regularly from Zogolopoulo Bros., Halim Pasha Buildings, Cairo. *The Autocar* may also be obtained from the same newsagency.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Belt out of Line.

**?** My engine pulley is an Advance, adjustable, dished out at the back to miss the boss on the crank case; but, at its lowest, with a 19in. back belt pulley, the high gear is not lower than 4 to 1, which I find too high for sidecar work. If I use a smaller engine pulley, not dished out at the back, and made to miss the boss, it would throw the belt line out by about  $\frac{1}{4}$ in. With a 5 to 1 top gear the running is improved tremendously. Do you consider that running this with the belt line out  $\frac{1}{4}$ in. will materially affect the wear of the belt; and if so, what would you advise me to do? A 21in. belt pulley would only make a slight difference, and, owing to present conditions, could possibly not be bought.—A.C.

We do not think the belt line being out only  $\frac{1}{4}$ in. would make any difference to the belt wear, though you would probably find the smaller pulley would. The only other way of reducing the gear is by fitting a larger belt rim, which, as you say, might be difficult to obtain.

### Difficult Starting.

**?** I have a Triumph, which is fitted with a B. and B. carburetter. The machine is very difficult to start. I had the magneto overhauled, but still no improvement has been effected. The machine is very sluggish in responding to throttle movement, and if the throttle is opened too suddenly the machine stops instantly.—McN.

As you have had the magneto overhauled, the most likely cause of your trouble is an air leak between the carburetter and the engine, or the carburetter badly adjusted, so that you get too weak a mixture. The sudden stoppages when opening the throttle also point to some adjustment of the carburetter being incorrect. Make sure the carburetter and jet are quite clean and adjusted correctly; also make sure there are no air leaks. Bind all doubtful points with adhesive tape. For easy starting make sure the contact points on the magneto are separating correctly (the gap should be exactly .4 mm.) See that the rocker arm is not sticking. Plug points should be clean and a gap of about  $\frac{1}{32}$ in. See that the valves are free in their guides, and the springs in good order. Do not give too wide a throttle opening at starting, and close the air. For an easy start a rich mixture and very little of it is what is wanted.

### Legal Silencer.

**?** Would you please inform me if my exhaust pipe is legal? My machine is a  $3\frac{1}{2}$  h.p. Premier (1914), with auxiliary exhaust pipe, as well as the usual exhaust pipe to the silencer. I have removed the extended exhaust pipe, which is  $1\frac{1}{2}$ in. in diameter, and fitted one 16in. long, 2in. in diameter at the silencer end, and 2 $\frac{3}{4}$ in. at the tail end. Would you please advise me if this is legal?—H.J.E.

Provided your machine is fitted with a silencer or expansion chamber, which reduces the sound of the explosion as far as can reasonably be expected, your machine conforms to the regulations. The fitting of an extension outlet pipe is not really necessary, but it is undoubtedly the best way of silencing a machine without causing undue back pressure.

### THURSDAY NEXT!

THE  
MOTOR CYCLE

### ANNUAL SPRING NUMBER

### Painting the Cylinder.

**?** Will you kindly inform me what cylinder paint (black), either home-made or manufactured, you consider most suitable for the cylinder of an air-cooled motor cycle engine? My motor cycle has been stored during the winter months, and I now find the cylinder very rusty, so thought painting would be the best method of hiding the rust. Can you suggest a better remedy?—N.A.C.

To obtain the best cooling effect, the cylinder is much better left unpainted, as the paint only prevents perfect radiation of heat. There is little to choose between any of the preparations sold. These can be bought from any accessory house. It is fairly satisfactory to use ordinary blacklead, as used for stoves. It should be mixed into a thin paste with a little paraffin, and then brushed well over the cylinder flanges, leaving as thin a coat of blacklead as possible. Before applying any of the paints, as much of the rust as possible should be removed with paraffin.

### Age for Driving Licence.

**?** At what age can a boy get a motor driving licence? Is there any difference between the age for taking a cycle or car driving licence?—E.J.

A licence to drive a motor cycle only may be obtained at the age of fourteen, but to drive a car seventeen is the age limit.

### Valve Timing.

**?** My engine is a 6 h.p. twin with mechanically operated valves. My difficulty is this. There is a great clearance, or space, between the inlet valve stems and tappets, as much as the thickness of a two-shilling piece. The exhaust valve stems and tappets have the correct clearance—almost touching. If I add tappet adjusters, or longer tappets, the inlet valves open before the exhausts close. If all the clearance is taken up they open decidedly earlier than should be. My engine is now timed correctly, I believe. The exhaust closes when the piston is one-sixteenth down suction stroke and the inlet opens when the piston is one-eighth down suction stroke (the makers' formula). The inlets appear to have the same lift as exhausts. Where is the trouble? I am told the running of the engine would be improved by the great tappet clearance being taken up.—H.C.

The clearance between the tappet and valves should certainly be taken up. Unless you have either new valves or new tappets, the only way is by inserting tappet adjusters, such as can be obtained from most large accessory stores. Many engines are timed with a slight overlap in the valve timing, such as you say occurs when the clearance is taken up; but if this overlap upsets the running of the engine the timing must be reset, which can be done very easily if separate cam wheels are fitted for the inlet and exhaust valves. We think you would obtain the best results by setting the timing as follows: Exhaust valves to close with piston exactly on top dead centre. Inlet valve to open immediately the exhaust has closed. If these settings are made correct, the opening of the exhaust and closing of the inlet will come automatically correct. There is nothing gained by keeping the exhaust valve open after the piston has reached the top of the scavenging stroke, whereas a fairly early opening, anything up to  $\frac{1}{4}$ in. from bottom of firing stroke, is most valuable. We fancy your present timing is rather on the late side.

### Position for Contact Breaker.

**?** I have taken apart the magneto (Bosch, type DA2) of my motor cycle, removing the end plate on contact breaker side, and withdrawing the armature from the opposite end. When I came to put this together I was at a loss to know the position of the contact breaker in relation to the armature, as I cannot find any marks. Also I notice that the armature rubs on the field magnet; in fact, it has a distinct knock when armature is revolved. Would you tell me also what is about the correct size jet for B. and B. for use with 3 h.p. engine?—A.R.

The contact breaker on all magnetos is keyed in position, so unless this key has been damaged there should be no difficulty in ascertaining the correct position, otherwise it is necessary to fix the contact breaker in such a position that when the ignition lever is fully advanced the armature should be just breaking away from the magnetic fields, that is, the metal portions of the armature should be at the top and bottom, while the contact points should be just about to break. We think you will find that there is either a key to secure the contact breaker or else some sign of where there has been one, which will guide you, and which we would advise you to have replaced. The armature should run extremely close to the pole shoes, but should not actually touch; if it does, it indicates that either the bearings are worn or the end plate is not screwed up in the correct position. The correct jet can only be found by experiment, but from 28 to 32 should be about right.

### Missing Fire on Pilot Jet.

**?** (1.) I should be obliged if you would tell me the cause of the misfiring of my 7 h.p. Indian at speeds below 20 m.p.h., especially on the pilot jet. The back cylinder has good compression, but the front is rather poor, and appears to have been overheated. I have had new valves ground in and new springs. The machine is very fast and powerful, and I am at a loss to know whether it is the piston rings or the timing. There is a good spark at both plugs. (2.) How is the cylinder taken off?—H.R.

(1.) Your trouble is not likely to be due to either the piston rings or timing. The most likely cause of the missing is the plug points being adjusted too closely together. On these machines on the pilot jet a wide gap, say  $\frac{1}{8}$  in., is necessary. Another likely cause—air leaks in the induction pipe; or the pilot jet air regulator, situated on the top of the pilot jet tube, may be incorrectly adjusted. Try varying this while the engine is running. Lack of compression in the front cylinder is probably due to insufficient lubrication. Adjust the mechanical lubricator to feed more oil to this cylinder. (2.) If your machine has detachable heads it is first necessary to remove such fittings as the carburettor and inlet

domes. These domes are secured by bayonet joints, and are sometimes rather difficult to remove owing to having become set with burned oil, and care will have to be taken not to damage the thread which secures the inlet pipe. After these and any other fittings have been removed, detach the cylinder heads by undoing the four holding down nuts, then two of the long cylinder studs should be removed from the crank case, after which the cylinders may be lifted off sideways.

### Rebushing the Connecting Rod.

**?** I am anxious to dismantle my 4 h.p. engine in order to have the big end of the connecting rod rebushed as it has become slightly worn, and, consequently, knocks somewhat. If you will give me a few hints as to how to detach the connecting rod from the engine-shaft I shall be pleased. There is a chain sprocket wheel on one side of the crank case which carries the drive to the magneto. This is held in position by a nut. (1.) Has this nut a right-hand or a left-hand thread? (2.) How are the flywheels fastened on to the engine-shaft? (3.) Am I likely to have any great difficulty in getting the piston and connecting rod off the engine-shaft? I am not an engineer, although I attend to the general care and little repairs which my motor cycle needs.—J.B.

Unless you are fairly skilled in the use of tools we would not advise you to try and take the flywheels apart yourself for rebushing the big end, as putting them together and truing them up again after the work has been completed is work for a skilled mechanic. (1.) This nut has a right-hand thread. (2.) The flywheels are attached to the crankshaft on tapers, on to which they are secured by locking nuts, which have to be very securely screwed up. (3.) Unless you have done work of this kind before you are likely to have considerable difficulty in driving the flywheels off the taper without damaging the thread of the crank pin. The work is fairly straightforward to anyone skilled in the use of tools. The whole engine will have to be removed from the cycle, and the cylinder and fittings removed. Then remove the pulley, also the small timing pinion. Open the crank case and remove the flywheels and connecting rod. We would then advise you to remove the piston by driving out the gudgeon pin, after first removing any set pins and other means by which this is prevented from moving. If no such fitting is present, the pin is probably only a taper fit, in which case drive the pin from the narrower end. You can then separate the flywheels by removing the lock nut on the crank pin, and drive the pin out of one of the flywheels. You will probably find a piece of brass and a hammer most suitable for this, or use a copper-headed hammer. With care it is possible to remove the small end bush from the connecting rod and replace it with a new one without

entirely dismantling the engine. By making a special tool out of a long bolt and nut the old bush can be drawn out of the connecting rod without liability of straining the rod. The new bush should be forced in in a similar manner. It will probably be found that after forcing into position the gudgeon pin will not fit the bush properly. The bush will then require reaming out to the correct size. While these operations are being performed it is advisable to cover the crank case opening with a piece of rag.

### EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.W.H." (Maidenhead).—Philipson pulley and Grado multi-pulley, for use on  $\frac{3}{4}$  h.p. free engine Triumph.

"J.C." (Cambuslang).—6 h.p. Lincoln Elk and sidacar. Reliability, consumption, and durability.

"A.C." (Notts).— $2\frac{1}{2}$  h.p. Allon. Speed, hill-climbing power, and consumption.

"H.A." (Woodford).—Spots. Amount of increase in petrol consumption; decarbonising effect.

"A.C." (Bude).—7 h.p. Power-plus Indian. Suitability as a solo mount, consumption, and ease of control in traffic.

### RECOMMENDED ROUTES.

SHREWSBURY TO EVESHAM.—M.B.

Shrewsbury, Bridgnorth, Kidderminster, Worcester, Evesham.

KIRKBY LONSDALE TO MORETONHAMPTON.—D.L.R.

Kirkby Lonsdale, Arkholme, Lancaster, Garstang, Preston, Wigan, Warrington, Tarporley, Whitchurch, Hodnet, Wellington, Bridgnorth, Kidderminster, Worcester, Fewkesbury, Gloucester, Painswick, Stroud, Nailsworth, Bath, Marksbury, Wells, Glastonbury, Durs-ton, Taunton, Wellington, Cullompton, Exeter, Moretonhamstead.

LEICESTER TO SOUTHPORT.—H.G.K.

Leicester, Ashby-de-la-Zouch, Burton-on-Trent, Uttoxeter, Stone, Pipe Gate, Moore, Nantwich, Tarporley, Chester, Birkenhead, by ferry to Liverpool, Great Crosby, Formby, Southport.

MARGATE TO HITCHIN, VIA SOUTH WOODFORD.—H.C.T.

Margate, Canterbury, Faversham, Sittingbourne, Chatham, Gravesend, ferry across river to Tilbury, Upminster, Romford, Chigwell Row, Woodford Bridge, George Lane, South Woodford, Chingford, Ponder's End, Enfield, Potters Bar, Hatfield, Welwyn, Hitchin.

### PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always having their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

**AUSTRALIA'S PREMIER MAN,

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.,** and crossed.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## Douglas.

**DOUGLAS**—Immediate delivery from stock; easy terms arranged.—Colmore Depot, London Agency, 44, Finsbury Pavent. [3505]

**DOUGLAS**, 2 1/2 h.p., late 1913, 2-speed, clutch, kick starter, all accessories, perfect; £36.—15, Warwick Court, Holborn. [3535]

**DOUGLAS**, 1914, 2 1/2 h.p., T.T. model, fast, complete, and in excellent order; £36.—Layton's Garage, Bicester, Oxon. [X6711]

**1914** Douglas, 2 speeds, T.T. bars, footboards, 2 1/2 in. tyres, specially mudguard, complete; £37/10.—5, High St., Macclesfield. [X6743]

**DOUGLAS**, 1915, immediate delivery any 2 1/2 h.p. model, including War Office black Douglas.—Moffat, Yeovil, Tel.: 50. [3903]

**DOUGLAS**, 2 1/2 h.p., model U, 1914 (Nov.), mileage 1,200, practically new, all accessories; £36.—21, Cavendish Place, Newcastle. [X6247]

**DOUGLAS**, 1912, 2-speed, T.T. model, lamp, tools, all in first-class condition; £27, or nearest offer.—Motorist, 6, Newton Rd., Paversham. [3283]

**DOUGLAS**, 1912, T.T., 2-speed, splendid condition, hardly scratched, P. and H. lamps, horn; £25 cash.—Figg, Castle St., Farnham, Surrey. [3365]

**1913** Douglas, 2 speeds, lamps, all accessories, splendid condition, fast, must sell; accept 26 gns.—T., 17, Rothsay Rd., South Norwood. [3368]

**1913** Douglas, T.T. model, excellent tyres, engine just overhauled, outward condition, good; £32.—Robinson's Garage, Green St., Cambridge. [3471]

**IMMEDIATE** Delivery new Douglas 3-speed, 1915 3-speed, 1914 2-speed, both as new; written guarantees willingly.—Gibb Gough, Gloucester. [3189]

**1915** Douglas, model U, semi-T.T. bars, 2 lamps, speedometer, done 800 miles only, as new; £46/10.—Robinson's Garage, Green St., Cambridge. [3472]

**DOUGLAS**, 1913, 2 1/2 h.p., 2-speed, and clutch, speedometer, lamps, and horn; £32; one ditto, T.T. model, £30.—E. Naldrett, 56, West St., Horsham, Sussex. [3352]

**DOUGLAS**, purchased June, 1914, not been ridden since the end of 1914, owner at Front, excellent condition, electric light; £40.—S. Montgomery, 50, Birch Grove, Acton. [3302]

**COLMORE** Depot, Birmingham, Manchester, Leicester, and Liverpool, have in stock complete range of all models Douglas for immediate delivery, also full range of spares. [X6560]

**DOUGLAS**, 1914, 2 1/2 h.p., 2-speed, perfect order, Millers lamp and generator, speedometer, horn, and all accessories, £39; also Auto-Wheel, £6.—Dudley, 12, Hilldrop Rd., London, N. [3301]

**1910** Douglas, 2 1/2 h.p., T.T.'s overhauled, reliable, good enamel and plate, Lucas lamp set, good tyres, tools; photo, stamp; £19/10.—Singleton, 15, Emore Rd., South Norwood, S.E. [3387]

**1913** Douglas, 2 1/2 h.p., excellent condition, newly overhauled by makers, wonderful power, climb hills 2 passengers; £25 cash.—Apply, D. M. Brittain, Ashfield, Poutardulais, S. Wales. [X6492]

**DOUGLAS**, 1914, 2 1/2 h.p., T.T. 2-speed. Binks, fast, in splendid condition, 2 lamps, mechanical horn; £35; seen by appointment.—Lt., 12, Maresfield Gardens, Hampstead. Tel.: 6779 Hampstead. [3232]

**1914** Douglas, model V, splendid condition, little used, Lucas lamps, horn, Watford speedometer, 3 buttoned tubes, all spares, despatch case; £38; appointment.—39, Earsfield Rd., Wandsworth—Battersea 3072. [3243]

**DOUGLAS**, late 1915, 2 1/2 h.p., 3 speeds, P. and H. lighting set, horn, Stewart speedometer, tools, etc., new belt and new tyres only done 2,000 miles, in perfect condition; £45/10.—Red House, Granville Rd., Sidcup. [3375]

**1913** Douglas, 2-speed, T.T. engine very fast and in perfect condition, enamel and plating very good; 33 gns.—Julian's, Broad St., Reading. Biggest motor cycle and light car dealers in the South. 'Phone: 1024. [X6188]

**1915** Douglas, 2 1/2 h.p., 3-speed gear, Sportan horn, absolutely perfect condition; to be cleared at 42 gns.; exchanges easy terms.—Julians, Broad St., Reading. Biggest motor cycle and light car dealers in the South. 45 years' reputation. 'Phone: 1024. [X4812]

**DOUGLAS**, late 1914, 2 1/2 h.p., kick start and clutch, semi T.T. bars, also touring bars, Bosch, Amac, also all accessories, tools, Lucas lamp set and horn, and Stewart speedometer, condition as new; £47, cheap.—V. Begeruie, 14, Grosvenor Rd., Westcliff-on-Sea, Essex. [2925]

**DOUGLAS** Agents and Specialists. We refrain from mentioning 1916 models, as at present there is no likelihood of obtaining deliveries. We can supply and deliver the latest models brand new at rock bottom prices. Tel.: 368. T.A.: Bicycles.—Robinson's Garage, Green St., Cambridge. [3469]

## Elswick.

**1915** Elswick, 2-stroke, 2-speed; £30.—J. Davis, Royal Military Academy, Woolwich. [3511]

**1913** Elswick-Precision Combination, 3 1/2 h.p., 3-speed, lamp, and spares, good condition and going order; £29.—Dale, 26, Powis St., Woolwich. [X6264]

## The Taxation of Motor Cycles. Where the Treasury Proposals Fail.

**T**HOUGH a general increase in the taxes on motor vehicles had long been expected in the new Budget, Mr. McKenna's proposals in Parliament last week in respect to motor cycles—examples of which were given in our last issue—created something of a bombshell. Many had been led to suppose that the tax would be doubled, but so far from being doubled, the tax on machines only just over 4 h.p. was trebled, and on the larger machines the Chancellor of the Exchequer proposes that the tax should be nearly five times what it was originally. These suggestions are altogether iniquitous and unjust. Practical men cannot have had a hand in the drawing up of the Budget, or no such impracticable method of calculating the horse-power on the bore only would have been devised. Even wealthy car owners are only called upon to pay double, and sometimes treble, the old tax; so that motor cyclists are threatened with the biggest load, yet they are of a younger class less able to bear the brunt of taxation. A strong fight must be put up to combat such an injustice, or a severe blow will be given to the motor cycle movement. But the Chancellor's proposals are altogether full of anomalies, and last week we lost no time in pointing out these anomalies and laying before the Chancellor a scheme we had formulated, which, whilst bringing in practically the same amount of revenue, is more equitable to motor cyclists in general, as it takes engine capacity into consideration. It had apparently escaped the Treasury's notice that under its proposed scheme quite a large proportion of motor bicycles would be taxed as much as £4 14s. 6d., whereas several makes of small cars would get off with four guineas. On three counts this is proved an absurdity. (1.) The original cost of the vehicle. (2.) The damage respectively caused

to the roads by two and four wheels. (3.) The fact that the small car weighs five times as much as the motor bicycle.

No practical man would ever dream of defining the power of a motor cycle engine by the cylinder bore only. In the case of cars this system of h.p. rating is by no means a success, though it may suffice. But the Treasury rating is an absolute failure when applied to small motor cycle engines. To take a case in point. There are two F.N. four-cylinder machines on the road, both having a bore of 52 mm., but one has a stroke of 57 mm., and the other 88 mm.; the nominal horse-power respectively is 4½ and 7. The last named machine is essentially a side-car mount by reason of its engine size and weight. The tax, however, would be the same in either case, viz., £4 14s. 6d. The other most striking anomaly quoted in our letter to the Chancellor is the case of a single-cylinder machine having a bore of 79 mm., which with sidecar outfit is taxed at the rate of two guineas, whereas a twin-cylinder solo machine only two-thirds the power is mulcted to the extent of three guineas.

It is considered that any new scheme of taxation which reduces the estimated revenue would be rejected, so that the efforts must be confined to placing the new taxes on a fair and square basis. Even lightweights and bicycles with motor attachments have been ignored by the Chancellor. It is to be regretted particularly that no rebate is allowed in the case of old-pattern motor cycles. It is hard lines on the man with a shallow purse, who cannot afford more than a second-hand machine, to be deprived of using that machine on account of the high rate of taxation, and we doubt not that there will be many such cases in view of the pronounced increases. To make matters worse, petrol still has an upward tendency quite apart from the difficulty experienced in obtaining supplies. Truly the lot of the motorist, at the moment, is not of the happiest.

## SOME SPORTING REMINISCENCES :

THERE are no trials to report in war time, so the editor has commissioned me, as the next best thing, to ransack my memory for reminiscences, humorous or pathetic, of bygone competition rides. It is odd how uncomfortable competitions are when you are engaged in them; how unfeignedly you rejoice when you check in at the last stage, whether your medal is won or not; and yet how your memory returns lovingly to those strenuous days and holds them better fun than all the peaceful go-as-you-please jaunts you ever had. On the one hand, the hotels are crowded—you may even be put to sleep on a 4ft. sofa with a carved mahogany

devil projecting from the middle of its back, as once befell me at Beattock, I think it was; the petrol stores are the scene of frenzied hand-to-hand fights, when you steal the one and only funnel from your best friend and scoot off without paying for your fuel because marks are in danger; a constant sense of extreme anxiety broods over your machine day and night, and especially around the tyres; the officials, normally your best friends, become more loathly than any Prussian for the week that the trial lasts; they are men without commonsense or a notion of fair play, and must be cajoled, brow-beaten, or even lied to—till Saturday night. Your dearest pal lies under suspicion of inserting silver sand in your crank case, sulphuric acid in your lubricant, water or paraffin in your petrol tank. On the other hand, there is nothing like trial riding. Looking back on it, you would rather climb Applecross in a snowstorm with an eagle-eyed marshal at every corner and a medal depending on every checked skid and there-and-back corner, than joyride the prettiest flapper in Surbiton down the Portsmouth Road. Still, it is time I deserted generalities and got to my muttons.

### The End-to-end Record.

My earliest memories are of the old M.C.C. hundred-mile non-stops, which usually started from Redbourne. We did about twenty-five miles out

At the top of Dinas Mawddwy in the 1909 Six Days. A Motosacoche lightweight is in the foreground, a reminder that lightweights are by no means a new type of machine.

## TRIALS AND RECORDS OF THE PAST RECALLED BY A VETERAN COMPETITION RIDER.

and home, being turned by a marshal on the triangle of turf surrounding a fingerpost; and our main anxieties were whether our steering lock would be small enough for the triangle, and whether our accumulators or platinum contacts would give out first. As very few of us really understood our machines, there were seldom more than a third of the entry left in after the first fifty; though Leonard Jones on a converted De Dion tricycle, and Milligan on a Bradbury once achieved undying fame by performing, I think, eight consecutive hundreds absolutely non-stop, though, of course, there were mighty tunings between Saturday and Saturday. Then I fell in with a manufacturer who had a goodish machine, and wanted a goodish advertisement to make it sell. Casting about for an opening, we noticed that Tom Silver then held the End-to-end record on a direct-belt-driven, accumulator-ignited Quadrant in sixty-four hours odd. Green as we both were, I actually rode my machine up to John-o'-Groat's to go at the record, instead of riding up a spare, and railing up the factory-tuned speed-beast. On reaching Groat's, whom should I find killing time rather lugubriously but F. T. Bidlake, and my hopes sank, to zero when he informed me that he was timing up G. P. Mills, the hero of so many pushed records over the classic course. However, the night passed amidst wind and hail, and there was no sign of Mills. Next morning I rode in to Wick to wire my manager, and suddenly I sighted a yellow figure in oilies bouncing crazily at speed over the litter of mud and rocks which then composed the terminal stretch of the ancient route. Mills had knocked sixteen hours off Silver's figures; and well he deserved his glory, for the rims of his Raleigh resembled the edge of a well-crimped pie-crust, and the soft flesh round his eyes was pounded into a bloody pulp by the night's hail. I revised my schedule, and started next day; but what could one expect of an engine which pared down its cams one millimetre per mile, for want of a rocker between cam and tappet, with a 40 lb. spring on the valves? Still, I remember as if it were yesterday an agonised moment in the cold moonlight when I reached a place where four roads met; I was six hours ahead of Mills's time, there was no direction post; there was no living soul within six miles; and my memory was an utter blank! End-to-end honours were not for me. On the next occasion my frame broke when the prize seemed

### READING FROM TOP TO BOTTOM:

A bunch of sidecars on Saintbury Hill during a 1914 trial of the Sutton Coldfield Club.

H. Gibson (J. H. P. Bradbury and co.) on Kenmore in the 1913 Scottish Six Days.

On Berriedale in the 1913 Scottish Trials.

"Outside assistance" on Kirkstone Pass in the 1914 A.C.U. Six Days Trial.

### Some Sporting Reminiscences.—

won; and on the last ride, some genius served me with a counterfeit lubricant which flashed into smoke when it touched the red hot piston.

### The Early Six Days Trials.

The next layer of memories, half paradise, half purgatory, has to do with the earlier six days trials. Their main terror consisted in the effort to climb test hills on single-gear machines. In most of these events I had no factory behind me; and I had not yet found myself as a tuner. Heavens! How many manifold miles have I not pushed prehistoric single-gear machines on all the best-known hills of British and Scottish roads. Be it understood that in those days it did not particularly matter whether you rode up the hill or walked it, so long as you got to the next control station in time, though, of course, a push lost you the little laudatory reference in *The Motor Cycle* which meant so much then. I wonder I live to tell the tale; my standard experience was, first, as long a pause as I dared make at the hill foot to cool off, see to the belt, tighten compression joints, and change oil; then a wild rush at the hill, terminating in bottled conks about 400 yards up; jump off and run till one's heart was conking too; stop for a breather; cock one's eye for a chance to restart; push up a side lane, or even over the naked heather, charge wildly down on to the road for another rush; final and hopeless peg out with glowing engine 800 yards from the summit; body absolutely done. If in England, kindly friends usually pushed one up; if in Scotland, you received genial condolences from fellow sufferers, and perhaps took it by turns to push each other up. Arrived at the summit, it dawned on you that if you could do, say, thirty miles in forty minutes, you could "save your gold." Down went the nose on the lamp bracket, open slammed the throttle, and a wild blind almost invariably got you to control on time. Anyhow, you usually got your gold medal at the end of the week, and smole when your manufacturer dilated in two-inch capital letter ads. on the marvellous performances of your accursed machine.

### A Double Gold Medal.

As I approach more recent memories, the cup grows sweeter. In 1911, I think it was, I first achieved one of my minor ambitions by winning a gold medal in both the English and Scottish Six Days, and the performance still reads creditably to me, for the machine was a rather raw  $3\frac{1}{2}$  h.p., apt to get unco' hot in sustained running, and equipped with a frictionful two-speed gear affording no lower an emergency ratio than  $6\frac{3}{4}$  to 1. The routes were the Harrogate course, including plenty of real bad hills, and the usual Scottish route. Of the two weeks, the English ride was almost a picnic. Even Sutton Bank caused me no grave anxiety. The main trouble was that the officials got alarmed at the prospective number of gold medals, and became unduly Prussian anent our efforts to tune up at the foot of a test hill. Now my loathsome German gear gave no lower bottom ratio than 6 to 1 on a  $\frac{7}{8}$ in. belt, and I could only get the necessary  $6\frac{3}{4}$  ratio by fitting a  $\frac{3}{4}$ in. belt for each test hill. I dare not run on the small belt, because I had only one of it, and it would never stand the racket of 1,000 miles; moreover, I did not know where most of the

hills were to be expected. However, in the end I managed to dodge the officials sufficiently to get the  $\frac{3}{4}$ in. belt fitted for every hill bar Sutton Bank, and by some miracle my engine took Sutton on the 6 to 1 gear.

### Hoist by his Own Petard.

It is a long step from Yorkshire to Wales, but one Welsh trial provides the most humorous episode of my memory. One of the cutest trial riders in England had pegged out with manifold troubles, which he had unexpectedly cured about half an hour too late. He jogged on with me in a very bad temper at his enforced disqualification, continuing till he should find a station whence he could train to town. He arrived with me at the next control, which was in charge of a small boy, acting as deputy postmaster. It dawned on X that he could bully this urchin into entering him as having arrived at the aforesaid post office about forty-five minutes sooner than he really had. No sooner said than done. Under pressure from X the urchin duly entered X both on the main sheet and on X's card as having reached Lllanydidlios at 10.45 a.m., it being already 11.35 a.m. X accompanied me rejoicing at his narrow escape from retirement under the time rules. X and I potted on together leisurely till we hove in sight of the next control, some ten miles away, where we got out our watches to verify when we were due in. It then dawned on X that he was hoist with his own petard. True, he was duly booked as having reached Lllanydidlios at 10.45 a.m., but on that very booking his maximum time at Aberbluebell, ten miles on, was obviously 11.15 a.m.; whereas, in fact, X had not started from Lllanydidlios until 11.35 a.m.! The cream of the joke was that X had solemnly to retrace his tracks ten miles to Lllanydidlios to catch a train to town, as there was no station at Aberbluebell.

### Hard Luck, and Too High a Gear.

I have almost omitted the Scottish Trials of 1911, tackled on the same machine, which was less kind than in England. The makers of my "bus" had foolishly devised a flexible wire control for the N.S.U. gear, and this control took 2 h.p. to operate, so that in about two miles of low gear work the quadrant broke. The intense muscular effort required to hold low gear in at the extreme left of the handle-bar quite upset one's steering; my ascent of Rest and Be Thankful was clean, but perilous, as that famous ascent was

M. Gouvernet, a well-known French motor cyclist, who has been on active service since the very beginning of the war. Our photograph, which shows Gouvernet on his Triumph, was taken early this month, and shows that he looks none the worse for nineteen months as a soldier.

## Mr. Dunlop heads a deputation.

“— In conclusion, I will summarise my points :

- (1) There is annually a sum of more than £3,500,000 going out of this country in the purchase of foreign-made tyres.
- (2) There is an ample supply of British built tyres to meet all legitimate demands without the importation of a single foreign tyre.
- (3) Foreign tyres, on account of their bulk, occupy an appreciable amount of valuable space and thus accentuate the existing shortage of shipping.

I submit, therefore, that on these three counts, the free import of foreign tyres at the present juncture is economically unsound and contrary to national interests.”

**Some Sporting Reminiscences.—**

littered with stalled machines, and how I threaded a serpentine course through them I shall never know, for my sensations were that I was seated on the left handle-grip, holding the low gear in with feet, teeth, and arms. Cairn-o'-Mount was a cruel blow. Half-way up my low gear seized, so that I was left with nothing but the  $4\frac{3}{4}$  to 1 top ratio. Even at that I should have climbed it but for a certain rider who shall be nameless. At one of the landings the Scottish road menders had been busy; in other words, they had blocked the entire road with a forty yard strip of stones and rubble a foot deep on a grade of 1 in 12 or so. Two deep ruts offered the sole chance of crossing this awful obstacle without being unsaddled. The left-hand rut was full of fallen men; just behind a very famous rider I took the right-hand rut, and he flopped over and baulked me a yard from clean ground. Needless to say, I never got my engine really going again with a  $4\frac{3}{4}$  gear on single figure gradient, and after a cruel push of nearly a mile I blinded into Aberdeen, with hopeless forebodings of to-morrow's gradients on a single gear. During the evening I visited the local agency, and startled its proprietor with a wild whoop as I spied an N.S.U. gear on a machine in his window; and what is more, it had tank control. When I fell upon it and removed the gear, the worthy man thought I was mad. Next morning the seized wire-operated gear came off my jigger, and on went the new gear and control.

**The Four Brave Men.**

By way of conclusion I will tell you, with apologies to Edgar Wallace, the story of the Four Brave Men. By this time I was getting old, and I no longer rode a two-wheeler as a competitor, but drove a car, with a bottle of the best in the sternsheets, as a full-fledged judge. Entering Inverness one evening I ran the car over a collie dog; as the dog was apparently trying to beat the Marathon record over the surrounding landscape, we judged it was not seriously hurt, and drove on into the garage. Next morning we timed the boys out, and prepared to make a cross-cut which would bring us to the lunch control

well ahead of them. When we were all aboard, I tried to bring the car out of the huge garage by making a wide cast, instead of reversing; but the more I steered to the left, the more obstinately the car went to the right! I just had sufficient sense to declutch, and we all four investigated. A short arm in the steering links had got bent by the collie on the preceding evening, and, when the wheel was put to full lock, this short arm slipped over a dead centre and reversed! The short arm was at best of rather nondescript contour, and there was no similar car in Inverness which could provide a pattern for it. We bent it back on the hit-and-miss principle and eventually got it approximately right. I and my three companions were the Four Brave Men. We did another 1,000 miles on that car without bleaching a hair, including many there-and-back corners overlooking Highland precipices; and it was an American car!

**A RUSE DE GUERRE.**

Special overall worn by French despatch riders when travelling over roads under enemy observation. The coat is painted a mixture of colours, so that the rider of a quiet machine so equipped would not be easily detected. The idea is, of course, not new, as artillery and transport waggons have been painted foliage tints in order to hinder observation by enemy aircraft from the earliest days of the war.

**BACKFIRING IN TWO-STROKE CRANK CASES.**

**N**OBODY has a bigger experience of pre-ignition and back-firing than I possess, for the years 1907-1910 saw some of my longest mileages, and just at that time most engine designers had a temporary mania for ultra-high compressions, and it was no uncommon thing for an engine to pull up dead almost instantaneously when it was burbling uphill at a good pace.

The reason was that the excessive heat generated by the super-compression had rendered some particle of dirt or metal in the combustion chamber sufficiently incandescent to ignite the mixture before the piston was reasonably high on the compression stroke. Sometimes a speck of carbon was the culprit, sometimes a rough edge on the interior casting, sometimes a sparking plug electrode, and in one case the edge of the screw-driver slot in the head of the exhaust valve got red-hot. I had almost forgotten these experiences

until the other day, when my two-stroke thoughtfully revived them by pegging out abruptly, with fearful choking noises in its crank case, repeating its misconduct on every long hill.

I was nonplussed for the moment, but managed to reach home somehow, only to discover that excessive carbonisation was the cause, and the engine regained its best paces after a good clean. A practised friend tells me that similar symptoms may arise with a perfectly clean engine if too small a jet is in use, the fault being equivalent to popping back in the carburetter with a four-stroke engine. Similar pre-ignition might further occur as the result of any form of overheating; I have heard of a case where the magneto timing slipped back a degree or two; the retarded ignition then produced excessive heat, and the spidery electrodes of a multiple-point plug gradually became incandescent.

# Tests Extraordinary of War Office Motor Cycles.

HILL - CLIMBING POWER IN CONJUNCTION WITH

Inset : Letting in the clutch violently.

WEATHERPROOFING QUALITIES ARE ALL IMPORTANT FOR ARMY WORK.

Occasional  
Comments**Conflicting Tales from the D.R.'s.**

Many of us have been a little puzzled by the very conflicting yarns we hear from the Front as to the roadworthiness of our modern motor bicycles under the unparalleled tests of war work in Flanders and France. We have all read glowing testimonials, signed by men who should know how things are; and we have many of us heard less satisfactory stories from isolated individuals here and there, some of whom are seriously perturbed at the alleged failure of the trade and of the War Office to carry out various simple improvements which they assert are urgently needed. I believe the main facts are somewhat as follows. On the whole, our motor cycles have done excellent work under conditions which are wholly unsuited for their employment, and are far more exacting than motor cycles have ever faced before. Uncle Sam doesn't chuck away good dollars, and his motor cycles are not, on the average, equal to our own; but he is exploiting his motor cycle services for all he is worth—*vide* any issue of any American service journal or motor cycling magazine.

**The Fly in the Ointment.**

On the other hand, some of the D.R.'s are not crack riders and mechanics, gallant and devoted though they are, and a few of the lurid tales of trouble one hears must be put down to the man and not to the machine, just as happens over here in times of peace. Over and above this, there appears to be a marked difference between the kinds of service which machines must tackle according to the nature of the rider's job. The despatch riders at General Headquarters and Army Headquarters have a picnic as compared with the men on duty at Divisional and Brigade Headquarters. The nearer the firing line, the more crumpled the road, the worse the mud, and the more violent and continuous the shell fire. Hence it follows that the men nearest the Front are less enthusiastic about their mounts than the men who have less mud, less shell fire, and smoother roads. If your mudguards are inclined to clog with road matter, you will not get very angry if you are on a smooth highway, with only two or three inches of mud, and no nearer reminder of the guns than a distant mutter. But if the road is full of craters, if the mud is a foot deep, if shells are falling every minute, and if your despatch is intended to bring up urgent reinforcements during an attack, a mudguard that is set a thought too close to the wheel will drive you crazy. The plain truth is that our motor cycles are doing excellently under phenomenal conditions, and that it is only when the conditions become literally impossible that they sometimes fail.

**Standardisation at the Front.**

Of the complaints to hand, most have to do with petty details; a chain case lets in mud, mudguards are set too close, the stand is not of the fly-up pattern, the gear change lever sometimes gets jammed with mud, and so on. The very pettiness of these mishaps annoys a man who is doing urgent work at momentary peril of his life, and he wonders—not unnaturally—why the trade and the War Office do not improve matters at once. Let me cite a parallel case. This very morning I received a catalogue from one of those firms which makes a living by selling off discarded Government stuff, nets, ropes, tents, clothing, and the like; much of it is listed as brand new, and most articles are offered at 50% reductions on what we, as taxpayers, originally paid for them. "Gross waste and extravagance," remarks the superficial critic. The plain fact is that a big concern must be run on standardised lines. Suppose a tent is the article in question. The stores clerk reports there are 3,000 tents left in stock, but hardly any poles, or ropes, or bags, or floorboards. An order has to be placed immediately for, say, 25,000 new tents complete. A much improved pattern of tent has been submitted, and the Department desire to adopt it. If they decide on the new pattern, it very possibly entails different ropes, poles, bags, and floorboards. The stock in hand at all Army depots all the world over must settle the question, for you must have supplies and accessories and replacements that will fit the model in use, and you must have them everywhere. What is the value of the goods to be jettisoned throughout the Army, and can you transport the new stock to where you want it? If the sacrifice entailed is small, and if transport is possible, the new model is adopted. If the stocks in hand are huge, if the improvements are trivial, if transport is impracticable at the moment, you must continue to supply the old model. This illustration gives a rough idea of the motor cycling situation. Doubtless the manufacturers could supply a slightly improved machine if they were allowed to; but the War Office cannot accept a variation (a) if it implies scrapping large stocks; (b) if transport is absorbed for more urgent needs; (c) if an immediate reorganisation of the repair and store depots throughout the Army is impossible. No individual rider devoid of experience of organisation on a gigantic scale can comprehend the complications and labour entailed by a comparatively petty alteration in engineering patterns. Nevertheless our deepest sympathy goes out to unfortunate men who, although they have important despatches to deliver, must bend down and scoop accumulated filth out of mudguards under heavy shell fire behind Ypres.

# Hill-hunting Adventures in Lakeland.

Lightweights on Buttermere Hause. The lake of Buttermere is seen in the distance.

By **GEORGE D. ABRAHAM,**

*Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc.*

"**T**HANK goodness for those rough-riding days in Cumberland!" Thus wrote a young officer who has seen something of the efficiency of the motor cycle as a military aid amidst the wilds of Serbia. On every war front, roadless and otherwise, our despatch riders have distinguished themselves and extinguished the hopes of many a wily enemy move, and when the full story of the war is told the superiority of the British motor cycle and its riders will be revealed as one of the winning factors. Well might the "despatcher" who has defied gravitation on the Serbian heights recall Kipling's lines—

"They sends us along where the roads are,  
But mostly we goes where they ain't.  
We'd climb up the side of a signboard,  
An' trust to the stick o' the paint."

But the stick of Stelastics were more comforting—a fact which was proved in those earlier, more peaceful hill-hunting days when British heights were first climbed by motor cycle enthusiasts. "What's the good of all this?" was a question often heard during those A.C.U. ventures of 1913, when "fearful surfaces" and "fearful gradients" were the order of the day. When Little came down to Wythburn after his strenuous climb up Helvellyn an old daleswoman said,

"Eh, laddie, it's nowt to be proud on; nobbut a fool would clim' a mountain on them things! What guid is 't?" The answer is seen in the modern perfection of the British machine. Excepting with foreign-built machines, there are few complaints nowadays about lack of sufficient clearance between crank cases and the ground.

## Honister Pass.

Yet before the Six Days Trial of 1915 our hill-hunting outings in search of a sporting course resulted in many unexpected adventures because designers had not realised that motor cycles must ultimately be able to go anywhere. One well remembers those first venturesome days when Frank Smith's Clyno started the rough-riding craze by tackling Honister Pass. A private early morning visit to the hill resulted in the crank case hiding itself hopelessly in the shaly gradient of Buttermere Hause, some miles from the real object of the trip. Alterations were made; but when the successful ascent of Honister Pass from the Buttermere side was actually achieved the ploughing crank case added vastly to the thrills of the spectators. The lesson was learnt, and by others also. The Clyno's motor-mountaineering in Lakeland prepared it for the shell-ploughed fields and roads of France.

The sporting side of motor-mountaineering was first revealed to the writer during that earliest attack on Honister Pass. Most machines were then of single gear, and some of the speed rushes at the rugged gradient were thrilling in the extreme. One famous rider, after failing time after time to top the sliding incline of 1 in 3 of Hill Step, at last succeeded. Then, with a shout of delight, he sped, with engine in full cry, up the easier upper slope. He turned joyfully to wave a signal of success as he passed close by us. Suddenly we were dodging the flying machine. Its rider had failed to notice an outstanding boulder in the wretched road surface, and he was flung a dozen yards down the mountain slope. Fortunately, Dame Nature had most thoughtfully supplied a soft cushion of grass for his reception.

A short time ago the question was asked in *The Motor Cycle* regarding the hill-climbing powers of the modern two-stroke lightweight machines, and what was the best ascent by a standard mount of this type. In this connection it is worth noting that early in 1914 a 2½ h.p. Connaught and a small 2¼ h.p. Clyno climbed Honister Pass. Both succeeded at the first attempt, and the former machine was ridden by a novice in rough-riding. Surely this was a unique performance for lightweight monnmts.

### Hill-hunting Adventures in Lakeland.—

A strange and remarkable adventure, due to a low-built engine, happened in connection with the pioneer motor ascent of Helvellyn by Messrs. W. B. Little and R. Drinkall in the autumn of 1913. This climb is one of the standing wonders of the district, and when the drivers of the "four-in-hands" point out the precipitous mountain front and tell their passengers a motor cycle has climbed the "mighty Helvellyn," few do more than class the story with the many doubtful yarns of Lakeland. Yet it is true enough, and true also that Drinkall drove his machine up two-thirds of the fearsome climb without any oil in the engine. It happened thus: A healthy rivalry existed between the two riders—Little on the  $3\frac{1}{2}$  h.p. Premier and Drinkall on the  $4\frac{1}{2}$  h.p. Quadrant—and at one place the latter secured a considerable lead on his companion. To keep this, speed was increased somewhat injudiciously when dashing at a steep pitch in the path. Suddenly machine and rider were lifted into mid-air by the back wheel striking a rolling piece of rock. Spinning in the air, the wheel came down into the gravel, ploughing through it for a firm grip. Unfortunately, a solid bit of Helvellyn projected through the pathway and caught the crank case a shattering blow. A ragged hole was left as big as a five shilling piece, and practically all the oil escaped instantly. Contributions of sticking-plaster and stamp-edging were applied, but the extra oil got away, and Helvellyn received more lubrication than the Quadrant. Despite the two hours' struggle on low gear, with fierce overheating meanwhile, the engine did not seize.

Previous to this expedition, Skiddaw had been climbed, and in the mid-summer of 1914 Sty Head Pass was

The rocky descent of Sty Head Pass to Wastdale. The rider is W. B. Little, now staff-captain in the Durham Light Infantry.

crossed by motor cycle for the first and only time. This was undoubtedly the severest hill-climbing test yet achieved, and one that Little, at any rate, will never repeat. "*J'eni, vidi,*" but the pass conquered must be said by all who have since attempted the outing. Gradients of 1 in  $2\frac{1}{2}$  were common. The rock-stricken Premier, which carried the successful rider over the sliding

scarps of the Sty, shed almost all its fittings excepting those vital to progress. Quite early in the climb, which was taken from the Borrowdale side, the kick-starter and other projections were carried away in the narrow passage of the path between big boulders. On a hidden corner a few days previously a difference of opinion between a Ford car and the Premier had ventilated the latter's petrol tank too effectually. The rough ascent of Sty Head soon showed that the repair had been faultily made. Despite much country soap applied to the gaping joints, petrol escaped quickly, and doubts whether it would last added to the sporting nature of the climb; as none was available within ten miles of the further or westerly side of the Pass, failure seemed a foregone conclusion. However, a keen rider came to the rescue and undertook the sixty mile ride round the mountains to meet Little at Wastdale with a spare tin of petrol. This arrived just as the roughly-handled engine gave its last gasp under the wild crags of Great Gable and within sight of the hotel.

### An Elusive "Aeroplane."

A few months after the outbreak of war the whole of Lakeland was scoured for traces of an enemy aeroplane, which was reputed to have a base and petrol supplies hidden somewhere amongst the mountains. There were innumerable adventures during the fruitless quest, and one of a party of budding despatch riders, mistaking Wastdale for Eskdale, made a brave attempt to climb the westerly side of Sty Head Pass. Supreme difficulties finally convinced the party that the scene of their struggles could not be the Hard Knott and Wrynose route. Darkness put an end to the attempt, and it is doubtful

"Hair-pin bending" on Howtown House. A glimpse of Ullswater is obtainable in the distance.

**Hill-hunting Adventures in Lakeland.—**

whether many of the wanderers reached headquarters before the early morning hours. That very night a scouting party on Scawfell said they heard the elusive aeroplane distinctly. Echoes play strange pranks on the mountains; doubtless the Douglas on the notorious pass was the only strange visitor in the sombre solitudes.

**The Lakeland Roads.**

This Easter time will probably see a large influx of motor cyclists in Lakeland, for after the long and trying winter of war work and worry there are many who must find a holiday on the heights the truest economy both nationally and personally. They will learn that the roads, especially those over the mountain passes, are in better condition than ever before. A visit to Honister Pass and the Buttermere or Ennerdale valleys by way of Derwentwater and through the Vale of Newlands will be found especially practicable. The gradients of Buttermere Hause are now repaired and comparatively firm. The same remark applies to the Devil's Elbow in the Newlands Vale, but perhaps the better surface here accounts for the growing fame for accidents of this sinuous hill. These have usually happened in the descent, and the farmers have tired of repairing the protecting rails at the lower awkward corner. They threaten a thorn and bracken buffer to catch the over-dashing riders who aviate unwillingly at the turn. Not long ago, even during the ascent of the awkward Elbow, a Morgan found the surface tempting to speed work. The driver, with a sporting lady

An awkward corner on a Lakeland mountain road. W. H. Carson, on his British Excelsior, climbing Church Hill, a sporting route from the Vale of Naddle in Northern Lakeland.

passenger aboard, negotiated the lower bend successfully, but the second turn proved a stirring surprise in more ways than one. At eighteen miles an hour the machine refused the turn, and swung across the steep slope and into the wall, finishing in a well-balanced poise partly on the wall with the discarded lady passenger more or less standing on her head on the hill. How-

ever, no serious damage resulted to either riders or machine.

**Ullswater.**

At this early season of the year the writer would especially recommend a visit to Ullswater, the home of Wordsworth's delightful daffodils, and of all Lakeland dales probably the prettiest in springtime. The keen motor cyclist should certainly visit Howtown Hause, on the comparatively unknown eastern side of Ullswater. It is a fascinating hill, and, with its seven curious "hairpins," led to many adventures in the days when single gear machines were in vogue. The writer still has marks to act as reminders of an attempted ascent as passenger on Little's toolbag. Recovery of progress round an upper corner was only possible by taking it at high speed. The turn was misjudged. We left the road and machine suddenly, and found the rocks very hard.

**Visit Lakeland at Easter**

It should be mentioned that the road is not yet made on the east side of Ullswater to allow the full circuit of the lake, but those fond of remoter Lakeland should follow the easterly side as far as possible, and explore Boardale and Martindale on the farther side of the Hause from Howtown. This is the best season of the year to see the herds of wild red deer which haunt the heights above Martindale. The severe weather has dispersed much of their shyness.

The whole Lake District is, in fact, very attractive in the springtime. The weather is likely to be better than at any other time of the year, with the possible exception of September.

A group of R.E. motor cyclist despatch riders who have finished their training and are ready to proceed overseas.

# Then and Now

JUST a summer or two ago, Sonny, [friends,  
Your machine and yourself were "fast"  
But I wonder if you and your Motor  
Imagined what glorious ends  
Your knowledge and riding would lead to—  
What deeds on your mount you would do—  
I doubt if you gave it a thought, lad—  
Your Motor or you!

Then, you and your mount were just jolly—  
Some remarked "Jolly nuisance," no doubt,  
As you flew past some portly old stager  
With throttle—well, nearly all out,  
Or may be some fairy-like flapper  
Reposed on the rear of your bike—  
No doubt you oft glance at her letters—  
"Jack, what's D.R. like?"

You will send her a line or two, Sonny,  
Just remarking "It's jolly good fun,"  
But you never will tell of the nerve strain  
Required for each strenuous run.  
You never will tell of the horror  
Encountered—I know that it's true,  
You won't let her hear of the danger,  
No, Sonny, not you.

But history will tell in the future  
Of hardships you splendidly bore;  
It will tell of the trials you suffered  
Day and night in this German-made war.  
She'll read of the deeds you accomplished—  
A hero you'll be when you're back. . . .  
Good luck! and a speedy return, lad—  
Bravo! Stick it, Jack.

1916.

--R. L. NYE.

# WEIGHT and CAPACITY

## A COMPARISON OF WEIGHT IN ITS RELATION TO H.P.

**T**HOUGH practically all classes of motorists find hill-climbing at speed their chief delight, and are never tired of comparing the hill-climbing abilities of their own and acquaintances' vehicles, few stop to consider what really governs speed in hill-climbing. What is this important factor? Nothing but the amount of weight carried for every cubic centimetre of piston stroke. It does not follow that the most efficient vehicle is the one having the highest rating of power to the weight carried, but the vehicle possessing the largest engine capacity to weight is usually the liveliest, nippiest, and fastest on hills.

Now, the power of rapid acceleration possessed by the average motor cycle is far in advance of that which can be attained on any other motor vehicle, with the exception of high-powered racing cars (aeroplanes are outside the considerations of these few notes). The reason of this is, of course, to be found in the fact that the motor cycle has a much larger engine, weight for weight, than a car, a light car, or a cycle car, though in the case of the single-seated three-wheelers the last-named class runs it pretty close. This is, of course, one of the reasons why the Treasury rating, otherwise known as the R.A.C. formula, presses so unfairly on motor cycles.

### The Importance of Gear Ratios.

Gear ratios, too, have their bearing upon the case, and, generally speaking, the lower the gear the better will the acceleration be, provided that the speed attained is within the power of the engine; for every engine has its limit in revolutions per minute, beyond which it will not go even when running light. Gears, however, can generally be altered to suit circumstances, and need not be considered at present.

We propose, therefore, to discuss the relationship of weight and cubic capacity as set forth in examples of some of the more usual types. No special machines will be referred to (except in one case), but the weights may be taken as a reasonable average for the type of machine in question, ready for the road and with a moderate amount of fuel in the tank. The rider or passenger is in every case taken to weigh 11 stone.

If, then, we find the number of pounds carried by every cubic centimetre of capacity, we shall have some measure of the power of acceleration and also of the ability to climb hills at speed that the different machines possess.

### Figures that Speak for Themselves.

The following tables give some comparative figures for the various types we have mentioned.

### THE JOY OF THE OPEN ROAD.

A lady rider who appreciates a mount with a reserve of power.

#### SOLO MOTOR CYCLES.

Weight in lb.

h.p.	c.c.	Bicycle	Rider.	Total.	lb. per c.c.
2½	350	176	154	330	.94
3½	500	226	154	380	.76
5	650	256	154	410	.63
7	990	300	154	454	.45

It will be seen that the larger power has a distinct advantage, for the 7 h.p. machine has only to propel half the weight per c.c. that the medium-weight 2½ h.p. machine has.

Of course, if the riders of the lighter bicycles were smaller men than those who ride the heavy-weights, the difference would not be so marked, but

500 c.c. motor bicycle. 380 lb.—  
76 lb. per c.c.

that is by no means always the case. In fact, many a little two-stroke lightweight is expected to carry a rider of 14 stone or so.

#### SIDECAR COMBINATIONS.

Weight in lb.

h.p.	c.c.	Bicycle.	Sidecar.	Rider.	Passenger.	Total.	lb. per c.c.
6	770	272	120	154	154	700	.91
8	990	350	152	154	154	810	.82

#### CYCLE CARS AND RUNABOUTS.

Weight in lb.

h.p.	c.c.	Car.	Driver.	Passenger.	Total.	lb. per c.c.
8	686	588	154	—	742	.75
10	1100	1400	154	154	1708	1.55

770 c.c. sidecar, 700 lb.—  
·91 lb. per c.c.

1,100 c.c. cycle car, 1,708 lb.—  
1·34 lb. per c.c.

2,300 c.c. four-seated car, 2,856 lb.—  
1·24 lb. per c.c.

In the latter class the 8 h.p. single-seater runabout (a G.P. Morgan) compares very favourably with a solo motor cycle of moderate power, and, as a matter of fact, shows very much the same power of rapid acceleration and ability to climb hills at a fast pace on top gear. The standard cycle car has about double the weight to carry, and naturally will be left behind, though it is capable of a good speed on the level or on moderate inclines.

#### MOTOR CARS.

Weight in lb.

h.p.	c.c.	Car.	Driver.	Passengers.	Total.	lb. per c.c.
10-12	1460	1650	154	154	1958	1·34
12-16	2300	2240	154	462	2856	1·24

Reference to the tables will show that none of the motor bicycles alluded to have a load as high as 1 lb. per cubic centimetre, even when a sidecar is attached and two persons carried, while none of the four-wheelers have a smaller load than about  $1\frac{1}{4}$  lb.

### MOTOR MACHINE GUN SIDECARS OF THE UNITED STATES ARMY. HARLEY-DAVIDSON OUTFITS BEING TESTED PRIOR TO BEING SENT TO THE MEXICAN CAMPAIGN

- (1) On a New Mexican cart track.  
(2) Switchback desert tracks.

- (3) Anti-aircraft practice.  
(4) A steep descent and bad surface.

- (5) Outfits at speed  
(6) Gradients have no drawbacks.

# PROPOSED TAXATION OF MOTOR CYCLES.

"The Motor Cycle" and the A.C.U. Suggestions, with Some Examples and Figures.

IT is impossible for a Chancellor of the Exchequer to please everyone, and we do not suppose that he tries to do so, but Mr. McKenna's proposals bear so hardly upon motor cyclists that they must, we think, have been adopted without the assistance or advice of anyone connected with the motor cycle movement. Of course, motor cyclists, like other patriotic citizens, feel that the country needs money, and they are prepared to do their share; therefore some increase in motor cycle taxation was expected, but that proposed has come as something of a shock. The motor cycle was perhaps the most highly taxed vehicle on the road already (certainly the lightweight was) with reference to power, weight, and road-damaging properties. Still a reasonable increase would have been accepted without a murmur.

At present the whole affair is shrouded in mystery. We know that motor cycles up to 4 h.p. are to pay a tax of £2 2s. Why, by the way, is the tax on motor cycles more than doubled, even in the case of the Auto-wheel attachment, when the car tax up to 16 h.p. is simply doubled? Again, why is the motor cycle tax on motor cycles with twin engines, even of low horse-power, increased in a greater ratio than that of the most powerful cars? *In very many cases the new tax is more than 4½ times the old.*

## The Unfairness of the R.A.C. or Treasury Rating.

The tax on motor cycles over 4 h.p. is to be three-quarters that of a car of like h.p., but it has not yet been stated how this dividing line of 4 h.p. is to be arrived at. If by the Treasury rating it will be grossly unfair, for the formula is in no way suited to motor cycles. For instance, a certain light car has an engine of 976 c.c., the bore and stroke being respectively 72 mm. and 120 mm. This is rated at 6.4 h.p. The J.A.P. motor cycle engine of equal size, with a bore and stroke of 85 mm., is rated at 9 h.p., *nearly half as much again*, while the four-cylinder F.N. solo

equitable results. If this is not done, we feel sure that the new taxes will be the means of forcing many owners to give up their machines, and that the reduction in revenue consequent upon this will be very considerable.

## TAXATION BY CAPACITY.

Letter addressed by "The Motor Cycle" to the Chancellor of the Exchequer.

7th April, 1916.

The Right Hon. R. McKenna, M.P.

Sir,—With regard to motor cycle taxation, may I be permitted respectfully to place before you the following important points.

## TAXATION ABSURDITIES.

4½ h.p. four-cyl. F.N. solo £4 14 6

7-8 h.p. four-cyl. F.N. sidecar same figure.

The proposals for the taxation of motor cycles are considered by experienced motor cyclists to be unjust and inequitable, as the following anomalies exist:

1. Quite a large proportion of motor cyclists will be called upon to pay £4 14s. 6d. for their machines, whereas there are several makes of small cars on the market weighing four and five times the amount of a motor bicycle which will get off with £4 4s. The makes of cars referred to are the Perry, Buckingham, and Jowett.

2. The taxation of motor cycles on the bore of the engine only is quite unfair. One example alone will prove this. A certain firm (the F.N. Co.) produces two patterns of four-cylinder motor cycles, both having a bore of 52 mm. One has a stroke of 57 mm., the other 88 mm. The nominal horse-power respectively is 4½ and 7. Under the proposed system of taxation the owner of the more powerful machine (which will easily take a sidecar, whereas the smaller one will not do so) will pay the same as the owner of the low-powered mount.

3. The owner of a single-cylinder motor cycle of 79 mm. bore by 100 mm. stroke—490 cubic centimetres capacity—will be taxed £2 2s. for his machine, which is quite capable of taking a sidecar attachment and second passenger, whereas the owner of a 2½ h.p. twin-cylinder bicycle must pay £3 3s., though the capacity of his engine is but 350 c.c., thus suitable for solo rider only.

## PROPOSALS.

The only fair method of determining the taxation of motor cycles is on the effective capacity of the engine.

I beg to place before you the following simple scheme of taxation, which should not reduce the revenue. I have been led to formulate this scheme with a view to overcoming the objections

I have outlined above, and which are already causing great discontent among motor cycle users. The scheme, which is based upon the capacity, i.e., power of an engine, is on a sliding scale, and will mean that owners of the more powerful motor cycles will pay proportionately:

Minimum tax to cover all machines up to 500 cubic centimetres capacity ...	£2 2 0
For every 125 c.c. or part of 125 c.c. (this representing roughly 1 h.p.) ...	10 6

## EXAMPLES.

The maximum sized touring motor cycle has an engine of 1,000 c.c. Thus, the tax would be £4 4s., i.e., not in excess of any car.

## TAXATION ABSURDITIES.

6 h.p. solo bicycle £4 14 6

8 h.p. light car (twin-cyl., 72 mm. bore) £4 4 0

machine with a capacity of 496, not much more than half that of the engines just referred to, is rated at no less than 6.86 h.p., and consequently becomes liable for a higher tax than a car of something like five times its weight.

Other examples, also showing the utter absurdity of the R.A.C. formula when used as a means of comparison between motor cycles and cars, will be found on another page. We trust, therefore, that a more suitable formula will be adopted which will give really

**Proposed Taxation of Motor Cycles.—**

770 c.c. is a popular size of motor cycle intended for side-car work. The tax in this case would be £3 13s. 6d.

I should explain that motor cycles are generally classified by their cubic capacity, so that there is no difficulty whatever in arriving at this. Practically every motor cyclist knows by heart the c.c. of his engine.

I beg to enclose a copy of the last "Buyers' Guide of *The Motor Cycle*," dated November 25th, in which the c.c. of each machine is included as a matter of course.

**ESTIMATED REVENUE ASSUMING THERE ARE 140,000 MOTOR CYCLES.**

Number of motor cycles not exceeding	500 c.c.	60%	176,400	0	0
" " " " between 500 and 625	625 c.c.	10%	36,750	0	0
" " " " " 625 and 750	750 c.c.	15%	66,150	0	0
" " " " " 750 and 875	875 c.c.	74%	38,587	10	0
" " " " " 875 and 1,000	1,000 c.c.	71%	44,100	0	0
Estimated Revenue .....			£361,987	10	0

I need hardly point out that excessive taxation will result in many motor vehicles being laid aside and unused, particularly in view of the high cost and scarcity of petrol. These remarks particularly apply to the older pattern machine, whose value is low, seeing that no rebate is offered in such cases.

I am, Sir,

Your obedient servant,

THE EDITOR.

**TAXATION ABSURDITIES.**

3½ h.p. sidecar .. £2 2 0

2½ h.p. (1910-1916) solo light weight £3 3 0

**TAXATION BY A.C.U. CLASSES.****The A.C.U. Proposal.**

Sir,—Motor cyclists generally do not, I think, raise any great objection to the proposed increase of taxation as they understand Mr. McKenna's reference to their machines. But it should be pointed out that, whereas motor car owners have, been asked to pay double, and as to large cars treble the former duties, the less wealthy owners of motor cycles have had the duty on their machines increased from at least more than double up to nearly five times as much as that previously paid. This will be a real hardship when it is realised that the Treasury rule as to horse-power rating of motor cycles will be used to determine the power of motor cycle engines, and that however accurate this method of computing horse-power may be for comparatively large engines, it (on account of technical reasons which I need not enter into) very considerably over-rates the power of a motor cycle engine. A few examples will convince anyone having any knowledge of modern motor cycles. The popular lightweight machine, the 2½ h.p. Douglas, would be rated at 4.6 h.p.; the 3½ h.p. single-cylinder Triumph would be rated at 4.48 h.p.; medium power sidecar machines, such as the 5.6 h.p. Clyno or the 6 h.p. Enfield, would be rated at 7.2 h.p.

It is estimated that to-day some 58% of the machines in use are under 4 h.p. as commonly understood, but under the proposed 4 h.p. limit the number would be reduced to 15%, whilst 18% against 7% would be liable to the maximum tax of £4 14s. 6d.

It is believed that in framing these proposals the Chancellor of the Exchequer based his figures on the nominal or makers' horse-power, and that the unfairness of rating motor cycles by a rule applicable to water-cooled car engines has not been brought to his notice.

If it is necessary to grade the taxation on motor cycles according to their power, I suggest that the cubical capacity of the cylinder (or, more exactly, the volume swept out by

the piston) should be the determining factor. Motor cycles have been so classified for competition purposes for many years past, with the result that the cubical capacity of any particular make of machine is generally known, tables giving the capacities of motor cycle engines are readily available, and manufacturers generally have conformed to these rules, so that motor cycle engines automatically fall into a few well defined classes. If a rating rule depending on capacity were adopted, I suggest that the tax should be increased from a minimum of £2 2s. by £1 1s. for every additional 250 c.c., i.e., approximately for every 2 h.p., making the maximum tax £3 3s., which is more than treble the duty previously payable. There are practically no machines of over 1,000 c.c. capacity, i.e., over 8 h.p.

But an even simpler method of taxation, which would be very easy to collect, would be to tax motor cycles at the rate of one guinea a wheel. There are approximately about equal numbers of sidecar and "solo" machines in use to-day. I suggest the former should pay £3 3s. and the latter £2 2s.

I have prepared tables showing the estimated revenue on various bases of taxation, and illustrating the unfairness of adopting the Treasury rating rule for motor cycles.

The figures stated, giving the total number of motor cycles in use to-day and the apportionment of this total number into classes of varying horse-power, are based on information in my possession, which I admit is open to some doubt, though personally I am satisfied as to its approximate accuracy. In any case, the difference between percentages as shown in Tables A and B is so marked as to leave room for considerable inaccuracies without affecting my argument that to rate motor cycles for taxation purposes by the "Treasury" rating rule is most unfair and inequitable. I need hardly add that the Auto Cycle Union is exerting every possible effort to get the new proposals amended.

Yours faithfully,

T. W. LOUGHBOROUGH,

Secretary Auto Cycle Union.

**ESTIMATED TOTAL NUMBER OF MOTOR CYCLES IN USE: 140,000****TABLE A.**

SHOWING ESTIMATED REVENUE ON A RATING BY NOMINAL OR MAKER'S H.P.

Rating.	%	Number.	Tax.	Revenue.
Not exceeding 4 h.p. ....	58	81,200	£2 2 0	£170,520
Over 4 h.p. and not exceeding 6½ h.p. ....	35	49,000	3 3 0	154,350
Over 6½ h.p. ....	7	9,800	4 14 6	46,305
	100	140,000		£371,175

**TABLE B.**

SHOWING ESTIMATED REVENUE ON "TREASURY" RATING AS APPLICABLE TO MOTOR CARS.

Rating.	%	Number.	Tax.	Revenue.
Not exceeding 4 h.p. ....	15	21,000	£2 2 0	£14,100
Over 4 h.p. and not exceeding 6½ h.p. ....	67	93,800	3 3 0	132,300
Over 6½ h.p. ....	18	25,200	4 14 6	295,470
	100	140,000		£458,640

**TABLE C.**

SHOWING ESTIMATED REVENUE ON A "CUBICAL CAPACITY" RATING.

Rating.	%	Number.	Tax.	Revenue.
Not exceeding 500 c.c. ....	53	74,200	£2 2 0	£155,820
Over 500 c.c. and not exceeding 750 c.c. ....	30	42,000	3 3 0	132,300
Over 750 c.c. ....	17	23,800	4 14 6	112,455
	100	140,000		£400,575

NOTE.—If tax on motor cycles of over 750 c.c. were reduced to £4 4s., the revenue from motor cycles of this class would equal £90,960, reducing total to £388,080.

**TABLE D.**

SHOWING ESTIMATED REVENUE ON A BASIS OF £1 1s. PER WHEEL.

Rating.	%	Number.	Tax.	Revenue.
Motor bicycles ....	52	72,800	£2 2 0	£152,880
Motor cycles with sidecars ....	48	67,200	3 3 0	211,680
	100	140,000		£364,560

**Date for Payment of New Taxes.**

Riders who have already paid their taxes are entitled to use their machines until August 15th without further payment. If, however, the machines are used after that date, a supplemental licence for the remainder of the year will be issued on payment of threequarters of the difference due.

A comparative table of taxes under the Treasury and "The Motor Cycle" schemes appears on page 358.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

## 25th BATTERY, MOTOR MACHINE GUN SECTION.

The Officer Commanding is  
Capt. Sinclair.

Photograph by H. R. Gwyer Gibbs specially  
for "The Motor Cycle."

The terms of enlistment in the  
M.M.G.S. are:

Pay, 1s. 2½d per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limits, 19 to 40.

Applications for transfers have been handed over to the M.M.G.S. headquarters for attention. It will save needless correspondence if we repeat that transfers from Territorial Units are not sanctioned by the War Office.

Three inspections of recruits were held by Mr. Geoffrey Smith last week, at Coventry on Tuesday, Nottingham on Wednesday, and London on Saturday. The names of those accepted for service are shown in the list below:

Aggio, C., West Hartlepool.  
Bailey, F., Kettering.  
Barber, R. A., Bromley.  
Barber, W. H., Smethwick.  
Barrett, F., Barnoldswick.  
Barton, A., Mexborough.  
Battini, R., London.  
Beresford, W. H., Walsall.  
Bicknell, S. W., London.  
Blackmore, E., Woking.  
Boul, F. S., Epping.  
Brear, E., Denaby Main.  
Brentnall, A. J., Alkington.  
Burton, O. P. B., Rugby.  
Buttall, H. J., Grays.  
Callahan, R., Hoxton.  
Cattermole, A. H., Ilford.  
Clarke, E., London.  
Clarke, W. L., Barnoldswick.  
Cleary, H. H., London.  
Coles, C. W., Poole.  
Cole, T., Grimsby.  
Cox, F. A., Blandford.  
Crampton, S., Thorne.  
Crowther, P. S., Dewsbury.  
Dircks, A. E., East London (S.A.)  
Dowling, F. R. A., Coventry.  
Elliott, R. G., Coventry.  
Fisher, G. C., Nottingham.  
Franklin, G. S., Cheddar.  
Gardner, B. R. L., Coventry.  
Gilling, H. A., Stapleford.  
Griffiths, C. F., Hereford.  
Hill, H., Finsbury Park.  
Hill, P. J. B., Hull.  
Holland, J., Burton Rossett.  
Ilingsworth, W. L., Dewsbury.  
Ingill, V. H., Birmingham.  
Johnson, W. E., Dewsbury.  
King, R. C., Peckham.  
Kingham, B. H., Birmingham.  
Kirby, W., Asford.

Lawrence, J. B., Northampton.  
Lewis, J. P., Clydach (Glam.)  
Limb, G., Chesterfield.  
Little, G., Hull.  
Lock, W. S., Brixton.  
Londman, N. C., Hove.  
Martin, W. C., Belvedere.  
Matthews, S. G., Herne Hill.  
Miles, A., Coventry.  
Nicholson, F., West Bridgford.  
Nightingale, E. G., Faversham.  
Payne, W. F., Peckham.  
Perkins, W. A., Wellingborough.  
Porter, G., Huncley.  
Prece, F. T., Walsall.  
Preston, A., Beckenham.  
Primmer, A. E., Watthamstow.  
Rule, F. J., Berwick-on-Tweed.  
Simmonds, A. G., Bournemouth.  
Smith, C. R., Coventry.  
Smith, E., Chatteris.  
Sole, D., Chatteris.  
Somerville, G., Piffenry.  
Souden, C., Portsmouth.  
Sponge, C. A., Eastwood.  
Staplehurst, G., Grays.  
Stockdale, E., London.  
Stoner, G. R. R., Eastbourne.  
Swift, J., Linsell.  
Thursby, F., Barnoldswick.  
Townsend, H. P. R., London.  
Treleven, J. H., Llannecon.  
Wells, J., Manchester.  
White, D. N., Kenilworth.  
White, F. A., Nottingham.

Witchelow, W., West Ealing.  
Wragg, T. H., Coventry.  
Wright, G. H., Castle Camps.  
Yorston, G. T., Guildford.

A member of the editorial staff of the *Daily Mail* was among the applicants accepted for the M.M.G.S. last week.

A form of application appears on page 358.

THE Editor has received a call for several hundred more recruits for the Motor Machine Gun Service, and will be pleased to consider applications from experienced motor cyclists and car drivers. A form of application is included in this issue, and each question should be answered carefully.

Recruits should note that though their suitability for one or other of the different branches of the Motor Machine Gun Service—sidecars or armoured cars, etc.—will be considered, no guarantee can be given that they will be employed with any particular section, e.g., men may be employed with other forms of motor batteries than the machine gun sidecar batteries, which are well known to readers.

A good number of car drivers have joined of late, specially to be attached to the armoured car sections of the M.M.G.S.

In the latest list of recruits is the name of A. E. Dircks, who came home from East London, S.A., with the intention of joining the Royal Flying Corps, but on applying at the War Office was informed that there was a waiting list of 1,500 names for this branch of the Army. Therefore he was advised to make application to Mr. Geoffrey Smith for a position in the M.M.G.S. (Armoured Car Section). It is interesting to note that Dircks served through the South African rebellion and also through the German South-West African campaign.

### Next Week's Arrangements.

The next inspection will be at the Recruiting Office, Masonic Buildings, Little Park Street, Coventry, on Tuesday next, from 11 a.m. to 4.30 p.m.

On Wednesday, the 19th inst., Mr. Geoffrey Smith will attend at the Victoria Rooms, Clifton, Bristol (opposite the Queen's Hotel), from 2 to 4.30 p.m., for the purpose of testing motor cyclists from the West country. Those who have made application from this district have been notified to attend. Any other motor cyclists or car drivers able to report themselves at the training centre promptly can be seen and passed at the same time.

## CURRENT

## CHAT

TIMES TO LIGHT LAMPS.  
(GREENWICH TIME).

April 13	...	...	7.20 p.m.
" 15	...	...	7.23 "
" 17	...	...	7.27 "
" 19	...	...	7.29 "

## Prices of Second-hands.

A great many people are wondering how the prices of second-hand motor vehicles will be affected by the increased taxes. The fact of foreign made machines being shut out may create a shortage and help to check any sudden drop in second-hand values.

## Importation of Motor Cycle Tyres.

In a Parliamentary answer, Mr. Pretyman says that the value of motor cycle tyres imported into the United Kingdom from all sources during 1913, 1914, and 1915 amounted to £101,000, £40,000, and £125,000 respectively.

## Who Said Petrol?

Petrol importation figures are very interesting these days when difficulty is often experienced in obtaining it for private use, and then only at an exorbitant price. Latest available figures show that a vastly larger quantity of petrol was imported into this country last month than in the previous month. The actual figures for the first three months of this year are:

January, 6,985,276 gallons.  
February, 7,522,377 gallons.  
March, 9,076,622 gallons.

In all three cases duty has been paid on slightly less amounts than the above figures.

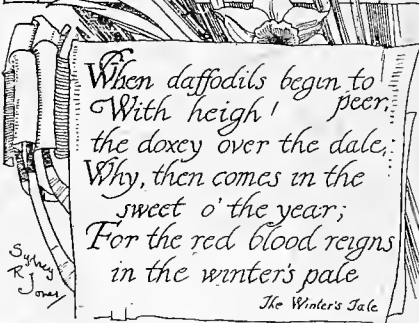

## Imports and Exports.

The Board of Trade returns for March, so far as they concern motor cycles, are remarkable for the big increase in the imports. In dealing with the February figures, it may be remembered that we commented on the favourable signs contained in the decrease of imports and increase of exports. However, such an increase as from 8 complete machines in February to 378 in March cannot by any means be explained as a mere fluctuation. The most probable explanation is that foreign manufacturers, fearing total prohibition of imported touring motor cycles, despatched as many machines as they could to England before the new regulations came into force, i.e., on March 27th.

The export figures show very little change over those for the previous month, and call for no comment.

The actual figures are:

IMPORTS.			
	March, 1916.	Feb., 1916.	March, 1915.
Number .....	378	8	63
Value, complete machines	£4,209	£347	£2,480
Value, tyres and parts ..	£5,152	£6,341	£7,344
EXPORTS.			
	March, 1916.	Feb., 1916.	March, 1915.
Number .....	1,093	1,133	770
Value, complete machines	£49,305	£49,960	£32,636
Value, tyres and parts ..	£7,175	£30,613	£6,359

## Negotiating a Dicker.

Our contemporary and namesake of Chicago has been poking fun at our description of Mr. Arthur Chapple's machine gun trailer, about which he has been "negotiating a dicker" with the Allied Governments. We wish Art. Chap. all success in his haggling stunt, and are grateful to our contemporary for putting us wise on this matter. Doubtless "Boss" Webster included the word in his "unabridged" out of compliment to our American cousins (for we notice he appends the letters U.S. to the entry). Meanwhile we are looking forward with much pleasure to the receipt of the dictionary, which, we understand, is on its way.

## SPECIAL FEATURES.

## ANNUAL SPRING NUMBER.

## SPECIAL ARTICLES AND ILLUSTRATIONS.

## Ten and Sixpence per Horse-power.

The Motor Cycle has written to the Chancellor of the Exchequer urging that engine capacity be considered in the new taxes. If 125 c.c. be regarded as 1 h.p., and 10s. 6d. per h.p. charged, the owner of a 1,000 c.c. machine would pay £4 4s., i.e., not more than a light car owner as at present proposed.

## The Motor Cycle Corps in the German East African Campaign.

We understand that 300 men were recruited for the Union Motor Cycle Corps for General Smuts's campaign against the Germans in East Africa. All the men are mounted on B.S.A. machines. There were many more applicants than vacancies, and several good riders had to be placed on the reserve.

## The Roll of Honour.

It is with sincere regret that we heard of the death of Capt. H. T. Whybrow, of the Motor Machine Gun Section. He died of wounds on his 36th birthday. Capt. Whybrow was well-known in parts of Africa as a big game shooter, and when war broke out he was in Bulawayo, but he at once came home and joined the M.M.G.S.

## The Taxes—The Topic of the Moment.

£800,000 is the increased figure the Chancellor of the Exchequer counts upon as a result of his new motor taxes. The method he proposes to obtain the increase is by no means popular and is indeed distinctly unfair. The A.C.U., as well as The Motor Cycle, were quick to point out the injustices and offer alternative suggestions. One recommendation of the A.C.U. was but a step removed from the scheme laid before the Chancellor by this journal.

## A Spring Number!

The current issue, being a spring number, contains many special articles, among which are the following:

"Some Sporting Reminiscences," by a veteran competition rider. Pages 336-339.

"Hill Hunting in Lakeland," by G. D. Abraham. Pages 343-345.

"Weight and Capacity." Pages 347-348.

"Angling Anecdotes and the Motor Cycle," by H. Mortimer Batten. Pages 362-365.

"Women Motor Cyclists on the Land," by Miss May Walker. Pages 367-368.

The burning subject of the hour—the new taxation proposals—is dealt with in the leading article, and also on pages 349 and 350.

### Australian-made Sparking Plugs.

According to our Sydney contemporary, *The Motor in Australia*, sparking plugs are now being made both in Sydney and Melbourne.

### R.E. Despatch Riders.

Married men only have been added to the waiting lists of the R.E. despatch riders' section of late, and then only men of at least 15,000 miles road experience of motor cycles.

### A Hint to Attested Men.

If you have any particular preference as to the section you desire to join, do not leave it until the last minute. Frequently men wait until they are due to report, and then expect a general choice of regiment, but only in exceptional cases can this be arranged, and recruits are consequently drafted into line regiments.

### U.S.A. Military Motor Cycles.

Pictures in this issue will indicate that the United States military authorities are making use of motor cycles in the campaign against Villa. Besides the fleet of Indian motor cycles with pillion seats and the Harley-Davidson machine gun outfits illustrated this week, the War Department has ordered a dozen machines with pillion seats from the latter firm.

### Comment on Motor Cycle Taxation.

In *The Sunday Times*, Mr. Gerald Biss, since he is no motor cyclist, wisely leaves the subject alone, but his general comment on the situation deserves mention. "It is questionable," he says, "whether the Chancellor of the Exchequer will reap any real financial benefit from the form of taxation he has selected, and whether he will not cause a maximum of locomotory inconvenience for a minimum of productiveness." This, we think, hits the mark exactly. What we concern ourselves with now is to get the taxes put on to a more satisfactory basis, and then, as we have to, pay, pay, pay. There is yet another important point, and that is the fact that the R.A.C. formula only takes the bore into consideration, and if it is adopted permanently its effect upon the design of motor cycle engines will be far-reaching, and, we venture to think, of small benefit either to the manufacturer or user.

### Hill-climbing in New Zealand.

Particulars are to hand by the last mail of a hill-climb held by the Otago (South Island) Motor Club on February 26th at Anderson Bay. A number of returned soldiers were present, and thoroughly enjoyed the proceedings. Competitors were divided into three classes, and each class was run on handicap. Results:

CLASS 1.			
1. A. Scott (2½ New Hudson) .. ..	53s.		
2. F. McDonald (2½ Douglas) .. ..	46½s.		
3. R. Charlton (2½ Douglas) .. ..	50s.		

CLASS 2.			
1. A. E. McDougall (3½ Triumph) .. ..	47s.		
2. H. Burrows (3½ Triumph) .. ..	48s.		
3. E. Strain (4 Triumph) .. ..	44½s.		

SIDE CARS.			
1. F. McDonald (2½ Douglas sc.) .. ..	61½s.		
2. B. Widen (3½ Douglas sc.) .. ..	67½s.		

SEALED HANDICAP.			
1. F. McDonald and R. Charlton.			
2. E. Strain.			

Fastest time of the day: E. Strain (4 Triumph).

### The National Relief Funds.

At the week-end the principal national relief funds stood as follow:

The Prince of Wales's National Relief Fund (£3,153,000 distributed) .. ..	£5,853,519	0	0
Fund for the Sick and Wounded .. ..	3,596,004	0	0
Tobacco Fund .. ..	103,530	0	0
The Queen's Work for Women Fund .. ..	168,961	8	3
The Belgian Relief Fund .. ..	1,502,785	0	0

### A New South Wales Consumption Test.

The Cumberland (N.S.W.) Motor Cycle Club has held a petrol consumption test in Parramatta Park. Each starter was supplied with half a pint of petrol. The first three places were secured as follow:

Rider and machine.	m.p.g.
1. K. Fatterson (4 Zenith) .. ..	148
2. S. Pincombe (3½ Rover) .. ..	131
3. M. Harding (3½ Zenith) .. ..	119

### Ill-considered Opinion.

It was news to the Treasury officials to learn that the R.A.C. formula is practically unknown in the motor cycle world. Not only they, but motoring contributors to the daily papers, who ought to know better, display equal ignorance. Mr. W. H. Berry, in *Saturday's Evening Standard*, writes: "Those owning motor cycles of higher powers (over 4 h.p. R.A.C. rating) cannot grumble at being called upon to pay threequarters of the duty chargeable against a motor car of similar rating, for many of the twin-cylinder motor cycle engines rated by the manufacturers as of 7 to 10 h.p. develop considerably more; in fact, some of the highly-priced high-powered motor cycles selling at anything between £80 and £100 with sidecar develop a greater engine power than many light cars proper." Clearly Mr. Berry is not acquainted with motor cycles, or he would never suggest that a 998 c.c. air-cooled twin-cylinder engine can equal in power a 1,100 c.c. four-cylinder water-cooled light car engine.

### The Inns of Court O.T.C. Regimental Hill-climb.

The first regimental hill-climb of the Inns of Court O.T.C. will be held at Toms Hill, Aldbury, four miles from Berkhamsted, to-morrow (Friday), beginning at 2 p.m. Mr. F. T. Bidlake has been appointed timekeeper. Altogether there are about forty entries, and the climb is taking place by permission of the Colonel and Adjutant. The surface of the hill is in excellent condition, and there is only one nasty bend, which, however, is not really serious. The organisation is in the hands of Mr. E. V. Ayers-Hunt.

### A Mysterious Failure.

The other day we had an interesting experience on a 3½ h.p. sidecar. The engine was started up quite well from cold, and was then stopped purposely, but considerable trouble was experienced in persuading it to restart. It was then stopped again, and on this occasion very nearly as great trouble was experienced in getting the engine to fire as on the previous start. A run of from ten to fifteen miles was then taken, during which time the engine ran quite well. After a wait of about threequarters of an hour the engine had to be again started, and this time was equally refractory. Once started it continued to run satisfactorily for a considerable time, but on the next attempt to restart it failed altogether.

The owner suspected a failure in the vulcanite high-tension brush holder, and when he came to fetch the machine the next morning he brought one of these with him. After fitting it the engine started immediately and ran without a misfire, but the curious part of it is that no puncture, hole, flaw, or crack is visible to the naked eye in the old brush holder.

### RECREATION AND RESTORATION.

## TRUE TALES OF THE DESPATCH RIDER.

Sidelights on the Life led by Military Motor Cyclists in France.

"THANKEE, sir, I knows a good 'un when I see it," as I handed him my cigarette case. "As I was sayin', what they would do in this 'ere without motors I don't know."

"Yes," I agreed.

The first speaker was a compact little man with keen grey eyes and a humorous, yet firm, mouth set in a weather-beaten but cheery face. He had offered me a lift as I trudged from my billet to my destination, and we were at the moment waltzing along the road from London to Berlin. Waltzing? Well, our progress would be more accurately described as a crab-walk. The *pavé* was covered with a coating of the very best skid-cream, and as we passed, and were passed by, various vehicles, our back wheels pirouetted solemnly from port to star-board and back again, as we made for the crown of the road after each deviation from it. But we were quite content—anything that tries conclusions with a motor lorry is likely to come off a distinct second best.

From the high seat of the heavy Leyland we could command a far-stretching view of the tree-lined and slimy road dotted with conveyances of all kinds, with smaller dots fitting in and out of the gaps in the traffic. Those little dots are always fitting about—they are the despatch riders.

### Unpleasant Riding for the D.R.

Down the road far ahead, now bounding about on the *pavé*, and then sloshing through the deep mud at the side of the road where the cavalry at times disport themselves, is one of these riders. He wears a wallet slung over his shoulder, and the blue and white bands on his arms proclaim the fact that the wallet contains the despatches from which he gets his name.

He is drawing nearer now, and, forced off the *pavé* by a touring car which has just passed us, he has to regain it afterwards. Now one of those incidents happen which do happen sometimes. We, too, swing across to pass a stationary lorry, so the D.R. must stay where he is. We all pass in a line, and as "Signals" sees our vast height towering above him he must feel a tremor lest we "crab-walk" off the *pavé* into him. But we don't, and he grins as the Leyland lumbers past.

The T.T. is no picnic. Nor is despatch riding under these conditions, but there is a sort of idea prevalent at home that these D.R.'s have an easy existence, and a hero's to boot. The last is always true in a quiet way, but the first—!

The wet weather out here impedes the progress of the D.R. in more ways than one. After the mud has dried a little he gets a magnificent automatic brake inside his mudguards. One evening we had a D.R. with a message for us; his face was all muddy, and his hands were indescribable.

Somewhat tentatively—for I did not want him to think I was doubting his ability to hold up—I enquired if he had had a "cok-siddle."

"No, sir," he replied; "I've only been scraping the mud out of my mudguards."

Now, manufacturers, do buck up. When the tale is told we shall hear of more than one effort being spoiled through a late message and consequent delay. You evinced no great keenness to

Lieut. F. M. C. Houghton, 25th Division Cyclist Co., writer of the accompanying article. It was he who suggested in a letter to *The Motor Cycle* the "all-khaki" race meeting held at Brooklands last August.

acquiesce to our demands in times of peace; now it is different. Increase that mudguard clearance, or fit a scraper.

We push-cyclists suffered in the same way, but found that much trouble was caused by the mud adhering to the walls of the tyres, so an ingenious artificer fixed us up with tin scrapers, which abate the nuisance considerably.

Of course, there are times when delay is unavoidable. One place the men go to is only ten minutes' run, but, as it is followed by half an hour's walk across a ploughed field, the total time taken is more like ninety minutes.

Some weeks ago a D.R. was in temporary trouble close to our billet, and we fell into conversation. He was adjusting the clutch of his 7 h.p. Indian, so naturally one of my first questions

was about the general handiness of his machine for this work.

He told me that on *pavé* it was excellent, owing to its spring frame, and that its weight was a help rather than a hindrance, as it kept him so steady, but, as he said to me, "When it *does* start skidding it is a fair devil, and you can't stop it." His Indian was the last of that make he had left after various events at Ypres. Then he shot off amidst a roar of explosions from his hefty "seven," but not before telling me that in his opinion the best machine of all for the work is the Triumph. Usual disclaimers!

### "Pip-Emma."

Of course, the D.R. has a certain amount of routine and discipline to follow and obey. In this particular Division, at any rate, the service head-dress is not insisted upon, so the men can wear comfortable sou'-westers, or whatever they fancy, though racing helmets seem popular.

Each night two are told off for duty from 8 o'clock to 6 a.m., when one goes round with what is called "the post," i.e., a regular delivery of certain information to certain units. The remainder take out their messages in turn, the night duty men resting till 2 o'clock.

Perhaps a few tales of exciting experiences may be of interest. I feel sure they will, but readers of *The Motor Cycle* will see at once that it is practically impossible for a D.R. to have any terrific adventures, such as being chased by an armoured car or "specially" shelled. I am indebted for these tales to a D.R. who has been out here since the early days of the war, has been wounded while on his machine, and has since been granted a well-deserved commission. He was naturally loth to tell me of his experiences, so I am respecting his reticence, and will give him the name he was known to me by.

"Pip-Emma," as he was dubbed from his connections with the Signal Service, came out here during the early days of the war on his privately-owned Triumph, which was taken over by the Government. He talked to me, and as he talked drew sketches on a piece of paper by his side; it was then I noticed he was ambidextrous. The scene of his first yarn was Givenchy.

He had frequently to carry a message along a road running straight towards the enemy lines, which made it necessary for him to extinguish his light after reaching a certain corner, where a sentry was posted to see this was done by all.

**True Tales of the Despatch Rider.—**

Now running parallel to the road on one side was a canal, and on the other was a railway embankment. It used to be the playful habit of one of our armoured trains to proceed down this line, fire a few shots at the Germans, and retire. For some days previously a stranger had been seen wandering about the vicinity in a suspicious manner, and "Pip-Emma" was warned to look out for him as he rode along by the railway. On the night in question the sentry warned him to be more vigilant than ever, so he went along at a level "20" with one eye on the glimmering ooze of the canal to guide him.

Suddenly he steered straight for the bank on his right, and, as he met it at an angle, he jumped off, and, to put it in his own words, "I rushed up the bank just in time to see a shadowy figure with up-flung arms hurl itself down the other side. I gave him two shots. The first man I had ever killed."

"But what," as "Pip-Emma" says, "was he doing on the railway line, and why did he run away?" Perhaps the smoke ring floating slowly to the ceiling could tell us!

Another unpleasant little adventure occurred along the same stretch of road. He had noticed protruding above the surface of the water a round hump, which he concluded was part of a dead horse. As usual, he was riding with his light out, and, before he knew where he was,

he saw some dark shape lying before him. Frantic efforts to avoid it availed him nothing, and into the soft and yielding mass he plunged head first. It was the dead horse, which had been pulled out of the canal and left there.

Nothing daunted, he scraped himself fairly clean and duly walked into the orderly room.

"Is that you bringing in that smell?" rapped out the Adjutant, without turning round.

"Yes, sir," was the meek response.

"Well, *get out!*"

So he got out, and gave his message through the window.

What it feels like to be under fire on a motor bicycle may be divined from "Pip-Emma's" next tale.

As everyone knows, the Huns have a habit of marking various cross roads and other important points for occasional doses of shell fire. On the day in question they had been doing this to a certain cross roads, near which was a supply of our ammunition. "Pip-Emma" was careering along near this place, when suddenly he heard a terrific roar and saw a huge wall of black smoke dead ahead. Thinking his last hour had come, he rode straight for the ditch. The impact made his front fork spring (Triumph) stretch out about a foot long. On its release it closed up again, but broke on the next shell hole. Our friend crawled out of the ditch and rode off none the worse. But it was a near shave for the ammunition.

Later, during a *strafe*, he was arrested as a spy by an officious Sergeant-Major, who detained him for two and a half hours, despite all his explanations and forcible language. Unfortunately, at the time, he had only a verbal message, and only a "pass" to prove his identity. This the S.M. would have none of, saying "Anyone can have a pass." But imagine the face of the Sergeant-Major when he was finally identified by the very person for whom the message was intended.

Now these little incidents are true. I have purposely omitted "Pip's" real name, as I am sure he would have wished it. And no one can deny the possibility of any of these events happening out here in the space of six months—nothing wonderful about them: just the plain truth.

F. M. C. HOUGHTON.

**A MACEDONIAN MESSAGE.**

We are in receipt of an interesting communication from an R.E. motor cyclist officer serving in Macedonia. "Three of my D.R.'s have got commissions in the line," he writes, "and two more have put in for the same job. It is rather heartbreaking to lose all one's best men, but this is usually the way in the motor cyclist section. The old 'Duggies' are still standing up, and have been running over six months now. They would do better with a three-speed gear box though, out here, as we get some fair hills, and the tracks on a wet day with a head wind are a nightmare."

SHIPS OF THE DESERT—ANCIENT AND MODERN.

A photograph taken by Cpl. E. Fedden, a Douglas-mounted despatch rider, in Egypt. The camel track running alongside the macadam road will be noticed.

## A BELT END PROTECTOR AND A NEW TERMINAL.

MESSRS. BROWN BROS. LTD., 15, Newman Street, Oxford Street, W., have lately placed on the market two accessories which will appeal to our readers. One is a belt end protector, a device which helps to shorten the distance between the belt ends, and causes the belt to rise to a higher line.

Brown Bros.' new belt end protector.

It also prevents the rubber stripping at the end and takes the strain off the holes, as the bending of the belt is lessened. Other advantages that are claimed for it are that it removes the initial cause of belt slip, and does not restrict free movement of the connecting link; it allows an extra link to be used without impairing the efficiency of the drive, prevents the fastener being accidentally damaged, and, moreover, it gives silent running by preventing the click, due to the metal fastener coming in contact with the pulley. The protector is adjusted to the fastener by means of the lugs D, as far as possible without interfering with the coupling up of the link, then the belt end is shaped so that it abuts closely to the shape of the protector.

The other device is a new form of an old terminal, which is instantly and securely fastened to the plug end on the terminal screw being removed. When once fixed to the wire it is absolutely secure and need never be removed, while the troublesome terminal screw, which is so easily lost, is done away with. It is made suitable for 7 mm. and 10 mm. high-tension wire. To attach the terminal, it is only necessary to squeeze the

New H.T. terminal introduced by Brown Bros.

two ends together, press it over the threaded end of the central electrode, and then let go, when it will grip firmly. After fastening on the wire, the ends B are clamped over with pliers.

## A LIVERPOOL MOTOR SCHOOL.

ONE of the many spheres invaded by women, as a result of the ever increasing demand for men for the Army, is that of motor driving, and the number of motor schools throughout the country has, as a result, greatly increased. Messrs. J. Blake and Co., who have been in the motor business at Manchester and Liverpool longer than we can remember, started a school some ten weeks ago, and the particulars thereof which they have sent us suggest that the whole affair has been organised in a most thorough manner. The Blake School of Motoring is at 22, Rodney Street, Liverpool.

## THOMSON-BENNETT MAGNETOS.

THE name of Thomson-Bennett for long before the outbreak of war was associated more with the production of general electrical apparatus as well as the manufacture of an excellently designed British magneto. The latter was gradually gaining popularity. When the shortage of German magnetos caused a great demand for British-made machines Messrs. Thomson-Bennett were in a good position to step in and take full advantage of this opening, and were marketing magnetos of all types, when other firms were only laying down plant and experimenting. The Thomson-Bennett range of models for motor cycles alone is very extensive, there being no fewer than six different types, covering

Thomson-Bennett magneto for twin-cylinder machines.

every pattern of motor cycle engine. During a recent visit to the T.B. works we were impressed by the excellent arrangements made for the prompt carrying out of the large orders on hand. In order to contend more satisfactorily with some of the Government contracts it has been found necessary to organise several new departments.

## TWO HANDY TOOLS.

THE valve spring lifter made by Messrs. A. T. Austin and Co., of Stinchley, Birmingham, has been slightly altered in order to cheapen pro-

Austin valve grinder (top) and valve remover.

duction and increase the supply. It consists of a lever made of flat steel, which fits under the valve spring cap. The fulcrum for the leverage is formed by a chain, which is attached to a round steel hook. The latter hooks into the valve cap orifice, and at the same time prevents the valve lifting when the spring cap is levered up in order to remove the cotter.

Another useful tool made by this firm is a neat valve-grinding tool, intended to be carried in the tool-kit, and with the aid of which it is possible to grind in the valves while the cylinder is in position, even though the tank overhangs. The tool consists of a cranked screwdriver which can be rotated by means of a rod having a bearing on the crank.

## LEOSCO TUBE SAVER.

FROM time to time we have heard complaints from motorists respecting tyre troubles due to friction on the spoke heads and corrosion by rust in the rim. Personally, we have not experienced this trouble for many years, since most makers of beaded edge covers allow a good overlap of canvas for the very purpose of protecting the inner tube. But no doubt an innovation by Messrs. Leosco Swain and Co., of

237, Deansgate, Manchester, will appeal to those of our readers who may wish to make doubly secure in this direction. The Leosco tube saver consists of an endless band of good red rubber, thickened in centre and tapered to the edges, which is intended to be stretched over and bedded down in the rim. It effectively prevents contact between the inner tube and the often rusty bed of the rim. The makers also maintain that it assists to hold the cover in place and prevents creeping. It is made in all sizes for motor cycles at 3s. 9d. each, and for cars from 5s. 9d. to 12s.

The Leosco band to protect spoke heads.

## CARE OF THE DOUGLAS.

ONE of the most comprehensive booklets dealing with the care and upkeep of individual machines is that published by Douglas Bros., a copy of whose 1916 handbook we have just received. There are over a hundred pages and many illustrations, some of the latter being "ghost" views and particularly interesting. It is written in simple language, so that the novice who starts with a Douglas will easily be able to derive many useful tips from the makers' booklet, a copy of which is included in the tool kit of each new machine when it leaves the factory. Quite a feature of the booklet is the wonderfully complete illustrated price list of spare parts. To other than purchasers of new Douglases, who have a copy free, a charge of 1s. is made for the Douglas booklet.

## ENFIELD GEAR IMPROVEMENTS.

TWO useful details have been lately introduced into the Enfield two-speed gear. One is an improved method of adjusting the main spindle bearings, the other a new adjusting mechanism for the engine chains. In previous models the cone for adjustment of the main spindle bearings was situated behind the driving sprocket, and was therefore in a rather inaccessible position. In the latest model this cone is made a sliding fit on the spindle, and, by means of a locking nut situated outside the driving sprocket, the cone can be tightened or loosened without disturbing the sprocket or any other part. The method of adjustment will

New method of adjusting main bearing cone of Enfield gear.

E. Main spindle. F. Sprocket.  
T. Lock nut for bottom bracket.  
Y. Lock nut for cone-adjusting nut.  
Z. Cone-adjusting nut.

In referring to the drawing, the method of adjustment is as follows: On the end of the bottom bracket eccentric will be found a lock ring T. This must be loosened, after which, by turning the worm W by means of a special square-headed spanner, the eccentric bracket is turned, and the necessary chain adjustment will be effected. The lock nut T must then be securely tightened.

## SIDECARRIERS FOR WAR WORK.

A SERVICEABLE sidecarrier has been supplied to the Triumph Cycle Co. by Messrs. the Gloria Cycle Co. for carrying munition material. The chassis is the latest pattern standard model Gloria, including spring wheel and special five-point attachment. In order to render the fitting of the large box carrier possible, the rear axle of the frame has been dropped and a special form of springing has been adopted. Instead of the usual transverse front and rear C springs, parallel quarter-elliptic springs both back and front are used, while shackles are fitted so that the full movement of the springs may be obtained.

The box body is covered by a lid, which opens in two halves hinged back and front. The nose of the body forms a spacious locker for spares. The whole outfit is well finished.

The Gloria Cycle Co. inform us that they are in a position to supply Government controlled works with these carriers provided they are to be used for war work purposes.

New method of Enfield chain adjustment.

W is the operating worm.

be clearly seen from the illustration, the bearings being adjusted by the nut Z and locked in position by the lock nut Y, both of which have right-hand threads.

In previous Enfield gears the eccentric gear bracket was held in position, by means of a quadrant, no means being provided for moving the bracket after the quadrant had been loosened. In place of this quadrant a system of worm and sector is now adopted, by means of which the bracket is not only locked after adjustment, but is also moved to the desired position, enabling very minute adjustment to be made.

A Triumph-Gloria sidecarrier engaged on munition work.

## Average Prices OF Second-hand Machines.

From "The Motor Cycle" of April 6th, 1916

It may be assumed that on all single-cylinder light-weights, whether two-stroke or four-stroke, the tax will be £2 2s. The observant reader will notice that the proposed taxes bear very heavily upon multi-cylinder machines, especially when of small and medium capacity.

See page 351 for the Recruiting Section.

# Letters to the

# Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

## Some Notes on the Operation of Two-stroke Engines.

Sir,—Under this heading Mr. William E. Slater put forward a new theory for their method of working. It was that when at the end of the stroke the burnt gas rushes through the exhaust port a partial vacuum is formed which helps the entrance of the fresh charge. I agree to this, and am willing to prove it, but I wish to wait till someone disagrees with it before I attempt a proof.

R. E. COLERIDGE.

## A Warning.

Sir,—Buyers of second-hand motor cycles are warned of a gang operating in London, who act as touts for unscrupulous dealers who have some old iron on their hands. They usually advertise from a private address, on the look-out for "mugs" who know little or nothing of the value of second-hand machines. For instance, they will invariably try to pass off, say, a 1912 machine for a 1914, and if the purchaser does not insist on a thorough test before buying, he is *had* as I was.

WARNING.—

## Pleasure (?) Motoring.

Sir,—With the new increase on railway fares, I certainly think the War Savings Committee should drop their anti-motor and motor cycle campaign, especially with regard to the latter. If only they would look further than their nose they would see that a saving of 50% at least would be effected by using motor cycles instead of the railway. For instance, at Easter I intend going to Burton-on-Trent. The price of a third-class single ticket, with the new tax, is about 11s., while at the outside the same journey by motor cycle would cost 5s.

Ordinary pedestrians look askance at motor cyclists at the present moment as if they were committing some criminal offence by taking their pleasure in the open air. Instead of police traps, we shall soon expect to see snipers waiting for us on deserted country roads to rid the country of such unpatriotic individuals.

H. GERALD SULLIVAN.

Herne Hill, S.E.

## Paraffin as a Fuel.

Sir,—The rising price of petrol makes the paraffin suggestions of your correspondents of considerable interest.

A few weeks ago I saw the following arrangement on a Triumph. The machine was started on petrol, which was turned off when the engine was warm and paraffin turned on. The paraffin feed pipe was taken in and out of the flanges of the cylinder, so when it arrived at the carburetter it was at a temperature at which it would vaporise much more easily than when cold. Of course, the paraffin pipe might have been taken round the silencer instead, as it might hamper the removal of the cylinder in the former case.

I should like to hear the opinions of your readers as to whether the compression could be lowered sufficiently for using paraffin by inserting a washer between the cylinder and the crank case.

F.W.A.

Sir,—The letters on the above subject are rather puzzling, if not actually contradictory. I am hoping for more and clearer explanations. I have tried a half and half mixture on my small two-stroke with Amac carburetter, and could not

start at all. Would "E.S." and "FE 535" give us a little more information? Apparently, very shortly, if paraffin cannot be used, we shall have to lay up our machines, as petrol will be unobtainable.

I should like to add that I feel sure Spots gives life and energy when added to petrol, but it does not seem to dissolve in paraffin.

R.C.W.E.

## Floatless Carburetters.

Sir,—No doubt it will be of some interest to readers, so I have the pleasure of drawing a rough sketch of one which

An old design for a floatless carburetter.  
See letter on this page.

H. B. HOBSON.

## What is a Spring Frame?

Sir,—As the designer of the Edmund spring frame motor cycle, and now a lieutenant in the R.F.C. serving in France, I have read with much interest a query by H. A. Steytler, headed "Spring Frame Design," and published in your issue of March 23rd. I would be glad if you would insert in your columns the following:

A spring frame, in my opinion, is one in which the springing is so designed to give the rider a maximum amount of comfort. This had been carried out in the Edmund principle by a double frame, one working through the other, and the movement between each being controlled by laminated springs, the combination forming a really efficient spring frame.

I might mention that I have no difficulty in obtaining my copy of *The Motor Cycle*, it being sold in most of the small towns behind the firing line.

CHARLES EDMUND HOLAWAY, Lt. R.F.C.  
B.E.F., France.

### Derby Groups and the M.T., A.S.C.

Sir,—I quite agree with "Subaltern's" remarks in your issue of April 6th, and I am sure many others are beginning to think the same way. Why such men as those in the M.T. and A.S.C. should be paid 6s. per day for practically no risk is more than I can understand.

I am going in the M.T. under the Derby Group system (at least I enlisted on that understanding), but I certainly do not expect the man who enlists for the trenches to get less pay than I who run very little risk.

Quite right, "Subaltern"; the war is not going to be won by driving motors; it is the man in the trenches that is really going to end it, and "Ex-South African Volunteer" must surely understand that women can quickly be trained to do our work.

Trusting you will see your way clear to publish this letter,  
ANGLO-INDIAN.

### Motor Cycle Taxation.

Sir,—With regard to the proposed increased taxation on motor cycles, I do not think any motor cyclist could object to the £2 2s. tax, but I do not think the proposal to make motor cycles of over 4 h.p. pay threequarters of the tax on a light car a fair or equitable one. This will bear very hard on riders of, say,  $4\frac{1}{2}$  h.p., and will simply cause a loss of revenue, as many riders of moderate means will have to give up riding. Could you not use your influence and the influence of your paper to have this proposal modified, say a sliding scale starting at £2 2s. for  $3\frac{1}{2}$  h.p. running up to the threequarter light car tax for high-powered cycles of 8-9 h.p.? I think this is a matter in which you could render great assistance to your readers.

J. H. PILLING.

Sir,—Is not this a real injustice?

The tax on the millionaire's 60 h.p. car increased by 200%.

The tax on the poor man's sidecar outfit increased by 372.5%.

Motor cyclists must tell the Chancellor that they are willing to bear their share of the increased taxes, but that a fair scheme should be substituted, say, 5s. or 7s. 6d. per 100 c.c.

R.J.B.

Sir,—Would I be presuming if I ask you to insert the following in your "Letters to the Editor" column? To take a few examples:

"X" has an old 8 h.p. twin and sidecar, used for business and pleasure, cash value £35 at the highest estimate; extra tax £3 14s. 6d.

"Y" has an up-to-date  $3\frac{1}{2}$  h.p. combination, used solely for pleasure, cash value about £80; extra tax £2 3s.

"Z" has a pony and trap, used for the same purposes exactly as "X," cash value about £50; extra tax none.

Other cases in plenty could be quoted, particularly the unfortunate owners of old cars, hard hit through taxing motors solely by horse-power. I think if taxes were imposed with more regard to age of machine and the cash value the higher charges would reach the man who without doubt is the best able to pay, viz., the man who can afford to take out a new machine each year. In any case, why this smashing, badly-aimed blow at motors? Lots of other things might contribute a portion, and, by taking a larger radius, be more evenly distributed all round. As a patriot I say that what we want is a downright straightforward war tax on all men to operate till the war is over, and not a penalty on a certain class.

A. PETTITT.

Sir,—Re your Note on the Budget, are your figures correct regarding twin-cylinder machines? If 81 mm. single is 4.07 h.p., why should twins 57 mm. to 72 mm. bore be 6 h.p. and 73 mm. to 98 mm. be 8 h.p.? My twin machine is, I think, 76 mm. or 78 mm., and I take it is between 7 h.p. and 8 h.p.

If 81 mm., then it would be, in my estimation,  $4.07 \times 2$  cylinders = 8.14 h.p., as I understand that in the case of an engine having two or more cylinders the h.p. is the sum of the separate cylinders.

If you are correct, then my machine is for sale or storage, as my mileage is too low to make it profitable to use the machine, the tax cost putting  $\frac{1}{2}$ d. per mile on my running expenses.

I might add that I do not mind doing my bit, if all users of other motor vehicles do theirs. The fly in the ointment is this: "Why are motor 'buses let off?"

Probably I shall be told, "Because they are commercial vehicles." Well, my machine is used about 60% for pleasure and 30% for business, but I get no rebate or consideration, yet I have to pay taxes to keep the roads in repair for these vehicles to knock them to pieces. The only compensation I get is plenty of dust (or mud), as their drivers refuse often to hear you or get out of the way, and the pleasure of getting shaken into a jelly, not to mention the damage done to the machine by excessive road vibration.

The railway companies have to keep their own roads in order; also, I understand, some of the trackless electric car systems owned by councils have to contribute towards the upkeep of the roads over which they run—so much per mile run.

The fairest tax, I think, is to tax petrol, then each one contributes his fair share, according to the horse-power of his machine and the miles run. By petrol I mean any spirit or gas used by internal combustion engines. HUT.

[Our correspondent has apparently criticised our figures without reading them carefully. We did not say that twins of 57 mm. to 72 mm. bore were rated at 6 h.p. —Ed.]

### Overheating on Two-strokes.

Sir,—I notice in your issue of March 23rd your contributor "Ixion" states, "If I set any two-stroke of my acquaintance to run ten miles on even a 7 to 1 gear the thermometers in the whole country would go up 10° apiece," and mentions that his present "two-stroke almost welds the piston to the cylinder after climbing not more than six hundred yards up a test hill on a  $8\frac{1}{2}$  bottom gear." I quite agree with your correspondent that some two-strokes do get terribly hot if driven all out on a low gear, owing, in my opinion, to insufficient and improper methods of lubrication.

Now for the past three years I have ridden the Levis two-stroke, and have yet to find one that will get uncomfortably hot, provided the driver will oil it freely. As a matter of fact, I regularly climb hills over a mile long with a  $2\frac{3}{4}$  h.p. Levis and sidecar with a 12 stone passenger on a  $12\frac{1}{2}$  to 1 gear, and when reaching the top I can almost bear my hand on the cylinder. The reason that these machines will stand up to it lies in their method of lubrication, coupled with their excellent design. As you are no doubt aware, the Levis principle of lubrication is to lead the oil direct to the cylinder wall and the main bearings, thence through the hollow crankshaft to the big end and magneto drive side. This means that all the working parts are running in oil, not oil fog as in most two-strokes.

G. W. WILKIN.

### A RHODESIAN BUILT SIDECAR.

Mr. H. W. Tyzack, of Que Que, South Rhodesia, sends us this photograph of a sidecar he and a friend built of light sheet steel. Attached to a 1913 Triumph it rides very well, we are told, and the object in building it so high was to keep the passenger free from the dust.

**The Shortage of Petrol Cans.**

Sir,—The following extract from "The First Hundred Thousand" is interesting in connection with your recent references to restrictions in the petrol supply:

"The water is conveyed to us in petrol tins—the old familiar friends, Shell and Pratt—hundreds of them. Motorists at home must be feeling the shortage."

T 4667.

**Carbonisation.**

Sir,—With regard to recent letters in *The Motor Cycle* re the cleaning of engines, I agree with "Nixon." I drive a 5.6 h.p. "Big Single" Excelsior and a 2½ h.p. Allon; from "Nixon's" description I gather that he has also owned that particular "Big Single." I drive with an Empress sidecar, and see no reason for taking down the engine before the completion of 5,000-6,000 miles; also, I never experience chain snatch, and Avon combination oversize tyres wear splendidly on the back wheel. This combination is a comfortable and "go anywhere" turnout. I drove my Allon 2,000 miles, and then took it to the makers' Holborn depot for cleaning (I had not time just then to do it myself owing to military duties); when I called for it, I was informed that no decarbonising had been done, as there was none to do. Since then it has run about 1,000 miles, and I took the engine down myself. It was all to no purpose; there was no deposit to remove, and the engine was like a new pin; this machine is comfortable, speedy, and will take me anywhere. I weigh 15 stone. It may interest your readers to know, also, that I find "Spots" excellent petrol savers, and there is less tendency to overheat when using them. Usual disclaimers.

H. J. DUNNE COOKE, Sec.-Lt.

**Average Speed.**

Sir,—On looking through the Correspondence Columns of your issue of March 30th, there is an effusion by "Top Feed Carburetter" that I cannot pass without comment.

The writer talks glibly of an average speed of 45 m.p.h. I wonder if he expects your readers to swallow such nonsense; if so, he is insulting their intelligence. Some months ago I did a run of 300 miles with sidecar and passenger. The machine was a very fast one indeed, and I was trying my best to do the distance in the shortest time possible. On the open road my speed was seldom under, and often over, 40 m.p.h. It took me exactly twelve hours' running time for the journey, average 25 m.p.h.

About the same time as my run I read in your pages of a North-country rider going down to Brooklands on an A.B.C. machine solo. While there he won several speed events. It took him ten hours for the 300 miles.

I have been a keen rider for eight years, and have owned ten of the best machines obtainable. Again and again, over give and take roads, and with early morning starts, I have tried to do distances of fifty and sixty miles in the shortest time possible to me, yet I have never been able to beat an average of 32 or 33 m.p.h. I am speaking of touring machines in perfect tune. This average meant all out on every inch of clear road. "Top Feed Carburetter," to average his 45 m.p.h. must get along in the open at about 72 m.p.h.—a speed of, I should think, at least 15 m.p.h. above the normal capacity of his machine.

For his information, let me say that on a journey from London to Edinburgh a Rolls-Royce that can do 60 m.p.h. with ease, and can go over roads at high speed, where a motor cyclist would be compelled to slow down, does not average over 24 or 25 m.p.h. on the journey. Further, does our friend know that the 10 a.m. express from King's Cross to Edinburgh does not average over 47½ m.p.h.? has only about five stops, no traffic, no cross roads, no pot-holes, etc.

I should very much like to hear what "Ixion" has to say about "average speeds."

OSBORNE BLYTHE, Licentiate R.I.B.A.

**Two-stroke after 1,000 Miles.**

Sir,—As several of your readers have given you their experiences of two-stroke engines, I beg to give you mine. I first took my engine down after 3,613 miles, as I thought I noticed a slight loss of power on the hills, but I was never more surprised in all my life. The amount of carbon deposit was so small that I am sure I could have gone quite another 1,000 miles, had I taken the trouble to clean out the exhaust port. This I had not touched; in fact, I had not touched

a single nut since the machine was new. I think this speaks well of the Levis workmanship.

The rings on the piston were quite free, with the exception of the top one; this was only partly stuck on the exhaust side, so slightly that I removed it quite easily. Carbon on the piston top was very slight indeed; in fact, nothing to speak of.

I replaced cylinder, and have not taken it off again, although I have covered over 1,600 miles, and I am sure I shall be able to get another 1,000 if things go on as they are at present. Wear and tear of tyres are very light, although I have had to fit a new one on the back wheel, because I was rather unlucky in getting it badly cut through having to go over some very rough country. A new belt was fitted at the same time, not because the old one was worn out, but because I was going on a 100-mile run, and I do not like tyre and belt trouble at night, especially in winter time. On my last journey in January this year I did just over 100 miles against rough weather and hilly roads at an average of 110 m.p.g., my average speed being 25 m.p.h. I can get up to 40 m.p.h., and the engine will two-stroke at walking pace. Of course I do not travel at 40 m.p.h. for long, as I have a great respect for my little engine, and I do not think anyone can wish for a better little mount for a lightweight. I might say I am in no way connected with Messrs. Butterfields, Ltd.

A SATISFIED LEVIS OWNER.

**Motor Cycle Taxation.**

Sir,—I hope you will use your powerful influence with the Chancellor of the Exchequer to get some modification of his proposals in regard to motor taxation. I would wish to appeal particularly on behalf of the owners of Auto-wheels. I have always felt that the taxation of £1 was grossly excessive, but now that it is to be doubled the disparity against these little vehicles becomes more pronounced than ever, and the injustice more keenly felt.

I am sure you would earn the gratitude of Auto-wheel users, most of whom are ladies, if you would take up the cudgels on their behalf.

FLORENCE E. LEPPER.

Sir,—Amongst the proposed new taxes introduced by Mr McKenna I observe that the tax on motor cycles under 4 h.p. is to be increased by 22s. Surely this will come rather hard on the owners of low-powered machines; such as baby two-strokes, also Auto-wheels. The many motor cyclists who have joined the Army will likewise be hit. To quote my own case as an example, I failed to join the R.F.C. as a cyclist on account of short sight, and am now in an infantry regiment for home service. Every fortnight I can get a week-end pass, and thoroughly enjoy a short run on my 3 h.p. Enfield. Now, after giving up a position worth £2 10s. a week, I have to pay extra on train fare to get home, an exorbitant price for petrol, and on top of that it seems that I must pay an extra 22s. per annum, all out of the large sum of 1s. a day. Otherwise I give up the one luxury I now have, and not entirely a luxury, as a certain lady friend lives twenty miles away from my home at Leyton. Could not soldiers be exempt until the war is over, when they would willingly pay?

While writing I must say a word in favour of my Enfield. After over 6,000 miles I have only had one engine stoppage, which was entirely my own fault. The gear is excellent and the machine takes all the hills I have tried, many in the Lake District. I have done 300 miles comfortably in a day, and a non-stop run of 120 miles in just under four hours, so you will readily understand I have no wish to part with so trusty a mount.

F. A. BUNN.

[We are sorry to tell our correspondent that unless some change is made his position is worse than he thinks, for on the Treasury rating, which is quite unsuitable for estimating the h.p. of motor cycles, a 3 h.p. Enfield is rated at 4.46 h.p., and the new tax will be £3 3s.—Ed.]

**SUMMARY OF CORRESPONDENCE.**

**MOTOR CYCLING IN A BLIZZARD.**—Mr Harry Smith, of the Rover Co., Ltd., writes: "The sequel to the paragraph published in your last issue is that on my return journey, when approaching Stivichale Corner, I got too near the ditch, and slipped in (trying to avoid a motor cyclist who was blazing away with his face to the blizzard). Result, had to leave the car in the ditch and walk back to Coventry."

### SOME USEFUL HINTS AND AMUSING YARNS.

**N**O outdoor sport or recreation has suffered less by the war than the sport of angling. Football, cricket, hunting, shooting, are all more or less at a standstill, yet our famous lochs and rivers continue to draw as many anglers as hitherto.

The explanation for this state of affairs is not far distant, for a day's angling can be arranged at short notice, and three or four participants are not necessary to the sport. The soldier home on leave or still in training, the convalescent, the busy munition worker—all are free to visit the water if their interests lie in that direction, and can one imagine a finer relaxation for jaded nerves than that of idling away the hours of sunshine with rod and landing net? The sidecar outfit or the solo machine is, of course, indispensable if one is to make the best of the day—quite apart from the pleasure of combining two delightful hobbies in a way that adds to the pleasure of both.

phone are alone responsible. A telephone message conveys the news that conditions for angling are favourable, and an hour or two later anglers from distant cities appear at the water's edge.

For the really keen fisherman, however, there is still an unlimited field for exploration. Bad roads and bad hills separate many of the finest angling waters from the thickly peopled centres, and the motor cyclist who has no objection to a little rough riding can generally evade the crowds. Moreover, the pleasure of fishing these virgin waters is quite worth the difficulties encountered *en route*.

#### An Independent Pastime.

What seems to me a great point about angling is the degree of independence it affords. On most trout rivers a good deal of energy is necessary if one is out to get fish, but the man who desires to slack it can do so without interfering in the least with the sport of his companions. If he sprawls on his back at midday and departs into oblivion till tea time, he is infinitely better company than the energetic soul who has fished his own allotted stretch by eleven and is poaching on his neighbour's water at exactly five minutes past.

My old friend Charles was the best hand at sprawling I ever came across. He had reduced it to a fine art. Charles is now in the trenches, patching up the wounded, and the only item of news his letters convey is that he still sleeps beautifully.

In the palmy days of peace Charles used to come snorting over from M— one or two days a week on his little two-stroke, and many new waters he and I were able to explore with the equipment packed aboard my sidecar.

One of these new waters was a moorland tarn which was reported to contain a gigantic breed of

Tackling up at the water's edge while receiving a few hints from the river keeper.

So far as the popularity of the motor cycle among anglers is concerned, every experienced fisherman knows that in most districts it has brought about quite a changed state of affairs. All sorts and conditions of anglers are now to be found on the streams which, four or five years ago, were visited only by the keenest of the fraternity, and for this the motor and the tele-

**Angling Anecdotes and a Motor Cycle.—**

trout. We arrived one sweltering August morning after miles of mountaineering, but only to find fly fishing out of the question owing to the absence of a breeze. After lunch Charles stated that he was going to try for one or two of the big ones with a little bait, and, of course, we knew what that meant. When old Cram, the boatman, and I pushed off, Charles was sprawling on a headland, his hat over his eyes, while his float reclined on the glassy surface just beyond the weeds.

A brilliant idea for enlivening the proceedings suddenly occurred to me. Obtaining a ball of strong string from the boathouse and a fair size stone from the beach, we secured the stone to C.'s line and the end of the string to the stone; then we rowed to the

the cobwebs of the boathouse window. His bellows of mirth almost gave the show away. After several hard yanks I began to haul in, hand over hand, literally dragging poor old Charles into the lake step by step. Soon he began to shout feverishly, but I was too busy with the two-stroke to hear him.

(Inset)

READY FOR  
ROAD AND  
RIVER.

Note rod-carrier attached to front forks of 1915 P. and M. A sketch on the next page shows this in detail. The complete rig-out of the rider will be noted.

WINTER ANGLING A famous grayling lay on the river Wharfe, Yorkshire.

opposite bank where our machines reclined, paying out cord as we went.

**A Thrilling Five Minutes.**

The rest was simple. Holding the string in one hand I started up C.'s little two-stroke as though making an adjustment, and, as its infantile roar stabbed the moorland stillness, Charles sat up and promptly discovered that his float was missing. I gave the cord a jerk, and out of the corner of my eye I saw Charles scramble up and strike savagely. Got him!

I watched the pantomime over the vibrating engine of the two-stroke, whilst Cram watched it through

Fortunately it was the gut cast which finally parted. Hastily I cut the string, then leisurely stopped the engine.

"You blighted idiot!" bellowed Charles, up to the hocks among the rushes. "Are you deaf?"

"What's up?" I enquired mildly. "Paddling?"

We will not pain the reader with C.'s description of that fish. When I state the "facts" that he saw it, and that it was about 6ft. long, the sympathetic will understand, though these facts were nearer the truth than C. ever dreamt. But the most painful part of the whole business is that, during the next few weeks, several other anglers described how they had hooked the same fish, and were able to bear out

### Angling Anecdotes and a Motor Cycle.

C.'s statements as to its size. The tarn became quite popular, and many a silver crown old Cram earned as a result of keeping his promise to me never to breathe a word.

The following winter I was round the same sheet of water after snipe, and, calling at old Cram's house, happened to observe: "Cram, I don't believe there are a dozen fish in the whole lake."

"There aren't," Cram agreed unblushingly. "Between you and me, Mr. B., old Tom Newbert turned his sheep dip into the beck six months before you was up, and killed every bloomin' fish! We raked them out with a hay rake, though nothing was said, or Tom would have been fined. That is between you and me, mind you! Two bloomin' cartloads of 'em!"

It was a memorable day for all of us. How the scent of the wet peat squelching under one's boots, the mournful piping of the curlews, and the hiss of the grasshoppers linger in one's mind! That day, indeed, when Charles and I fished a lake devoid of fish—the long upland climb with high expectations, the swift return in the cool of the evening with empty baskets but light hearts, the final drop to the highway, where the dust had settled and the sweet scents of dusk were abroad across the lowlands—will live longer in our memories than many a long-planned visit to some recognised angling resort. And this only goes to prove that the actual taking of fish is of minor importance in the sport of angling.

### Necessary Equipment.

For anything on the lines of an angling tour a sidecar is, of course, desirable, but in these days few of us have time or inclination for touring. A sprint to some favourite water and back is the best we can manage, and for this kind of work a solo machine fills the bill perfectly. It is usually possible to leave one's tackle at the other end, and even if this cannot be arranged, the necessary equipment can be carried aboard if one goes the proper way about it.

One's creel (see sketch) should be provided with a tray, so that the fish occupy only the bottom portion, and it *must* be strong enough to sit down on.

Rods are not easy to carry on a solo machine, but a very simple carrier, which I have used for some years, can be made as shown in accompanying illustration. It is covered with American cloth or canvas, so that it somewhat resembles a golf bag, and is secured (1) at the front wheel spindle, and (2) at any other unsprung point of the front forks. If it can be fixed vertically in a sprung position, so much the better.

Another angling and motor cycling companion, who has many times caused me endless mirth, is a plump and cordial incumbent, known to his intimate friends

as the "Jovial Monk." The most memorable day was that on which the parson caught a little lamb. He was seated serenely by a favourite pool, slinging in quantities of ground bait (against the rules, by the way) when, on throwing his line behind him, his hook caught in something which turned out to be a sheep.

The sheep, of course, bolted, the parson in pursuit, and we watched him playing it across the pasture, much as one might play a big salmon.

After about ten minutes of this kind of thing the incumbent became tired, and tried to persuade the sheep to come to him—to nim-nim it, in his own words. But it happened that the sheep became tired of it at about the same time, and from a tame old ewe it suddenly evolved itself into an irritable old ram—a "beastly old buck" as the parson later described it. Back went its ears and down went its head. The parson had no time to slip aside. With a bellow he leapt straight into the air, his legs wide apart, and the ram passed under him.

It was really a most remarkable feat, worthy of a chamois. I should never have believed so fat a man could be so wonderfully agile. With proper training and suitably garbed, the parson would have made a toreador, but with a fishing rod in one hand, landing net in the other, huge boots, and a huge sun hat, he cut a most remarkable figure, leaping high into the air to evade his comparatively small opponent.

Twice the old ram charged, and twice the incumbent cleared it by at least two feet, then the beast quietly walked away, which was very fortunate, since the incumbent was becoming trussed up like a chrysalis in his own tackle. Needless to say, he did not pursue the argument as to which of them was to possess the hook, and that evening an amateur Bobby Burns who was with us immortalised the event in a song of his own, set to music of his own. The first verse and the chorus went as follow:

The Parson hooked a wee white lamb,  
That gambolled gaily by,  
But when the lamb turned out a ram  
The Parson jumped sky-high.

*Chorus.*

We know he's hooked a fish\* or two,  
And many a gay brown trout,  
But when he hooks an old buck ewe  
You ought to hear him shout.

\*Fish equals salmon.

### The Gift of Driving.

The incumbent became a motor cyclist many years ago, but he is still, and always will be, a tyro. He is one of those beloved creatures who study hard at the anatomy of their machines, but who always allude to the change speed lever as the clutch and the tank as the tin. Its inner workings remain aloof from him, vague and incomprehensible as the skies.

Always he goes in for the most powerful sidecar outfit to be bought, but how is it that the incumbent, though he is not afraid of opening the throttle, can get no more out of his 7-9 h.p. twins than the average

A rod-carrier that can be attached vertically to the front forks of a motor cycle.

The most useful type of creel is provided with a hinged lid and bottom, and is fitted with a tray for tackle, etc.

**Angling Anecdotes and a Motor Cycle.—**

rider can get out of a 4 h.p. single? It opens up a rather interesting line of enquiry, for it is strange that a natural gift for mechanics should help one so considerably in the manipulation of the levers. At all events there is no doubt that the man who does not possess this gift can never obtain a reasonable response from his engine.

One day the incumbent and I were visiting a loch hidden in the heart of one of those gigantic Inverness-shire fir forests, and after many miles of deep ruts and swamps we came to a point at which the road divided. The parson swore we ought to turn left, and I swore we ought to turn right. After quite a heated

argument, we started up our respective engines and pursued our respective ways, each following his own views on the subject.

Less than eighty yards further on we met again, the roads once more converging into a single track, and there, just ahead of us, was the glittering sheet of water for which we searched.

So here's a toast: May the rough and rutty trail of to-day come to a sudden end; may we meet again unexpectedly after the long dispute, at our sides the faithful old jiggers that have served us well and uncomplainingly over the bumpy road, and which have carried us once more within sight of many a happy hunting ground.

## THE IMPORTANCE OF ACCESSIBILITY.

### Difficulties Encountered in Removing a Gear Box. By "Ixion."

**T**HE experience described below undoubtedly constitutes an extreme case, and is set out as a warning to the trade in general. Too many machines are designed and constructed in utter forgetfulness of the unfortunate user, who may have to take them to pieces against time with no other tools than those provided in the four-and-sixpenny roll sent out in the toolbag. It is hoped my recital may move one or two of the less thoughtful manufacturers to see how far ordinary tools are adequate for handling their standard machines.

The machine in question developed gear trouble at a distance of nearly 300 miles from its factory of origin. The exact nature of the trouble could not be diagnosed with certainty unless the gear box was removed and disassembled. It was, of course, possible to rail the entire machine to the works after transporting it six miles to the nearest station; but in the double interests of certainly saving money and possibly saving time, I decided to dismount the gear box for myself. The following special difficulties were encountered:

#### **Preliminary Troubles.**

(1.) Before any transmission item could be disturbed the magneto chain had to come off, as the magneto sprocket was outside a transmission sprocket on the engine shaft. The magneto sprocket was secured by a nut sunk in a recess; a very special tube spanner had to be made to unscrew this nut.

(2.) When this nut was removed the rear half of a chain case prevented the sprocket being sprung loose by levers; a special sprocket-drawing tool was essential.

(3.) A countershaft pulley was the next item for removal. Its nut was easily taken off, but the pulley was tight on its key and taper, and no wedges could be used, as a light metal chain case lay behind the pulley. A special pulley-drawing tool chanced to be available, but had to be softened and bent to a special

shape, owing to various items in the disposition of the pulley.

(4.) Two countershaft sprockets presented the next obstacles. Both were secured on splined shafts and locked by nicked rings and grub screws. Each had to be drawn off its splined shaft with a special sprocket drawing tool; and the tool employed for shifting the magneto sprocket was useless; finally, this tool was utilised in connection with two short lengths of chain ending in hooked links.

(5.) A transmission chain on the flywheel side could obviously never be replaced unless the flywheel was withdrawn, as the sprocket lay inside the flywheel and could neither be touched nor seen until the flywheel was off. The flywheel nut was easily withdrawn, but no wedges or levers could be used to shift the flywheel; fortunately it yielded to heavy hammer tapping on the crankshaft nut, though such usage is bad for the bushes and the thread.

#### **Another Delay.**

(6.) It now looked possible to dismount the gear box, provided its four nuts could be unscrewed. A special spanner had to be made to get at one of these nuts, after eleven various spanners of the correct jaw opening had been tried in vain.

(7.) But the next discovery was that the gear box could only be removed if the magneto were first taken clean off the machine, a process which incidentally implied the disassembling of a complex flexible wire control to the contact breaker.

The entire job occupied two skilled mechanics with an unusually large assortment of tools for a period of six hours. The bulk of the work would be necessary if one of the transmission chains had to be removed for replacement or a thorough cleaning. The work of reassemblage is likely to take quite as long. The yarn sounds incredible, but is literally true in all its details and indicates the gross carelessness of some designers in the matter of accessibility.

# A PLEA FOR THE FOUR-CYLINDER ENGINE.

Monobloc Aluminium Cylinder Casting with Steel Liners Recommended.

**A**T irregular intervals there appear in *The Motor Cycle* letters and articles on the subject of four-cylinder engines. The question of advantages and disadvantages is a vexed one, and people are apt to take sides on the matter rather violently without thoroughly examining the pros and cons. As one who views the matter with considerable interest and leans rather toward the adoption of multi-cylinder engines, I venture to put forward a few suggestions which may be worth consideration.

The beneficial effect of even torque on the wear of the transmission and tyres needs no discussion, and most readers will realise that even torque will mean rapid acceleration and great flexibility. Size for size, a four-cylinder engine will be infinitely superior to a single, or even a twin in these respects, a good horizontally-opposed twin being the nearest approach to the four-cylinder on account of its even torque and excellent balance.

The question of a multiplicity of small moving parts is usually raised against the "four," but few people seem to realise that a 1,000 c.c. four-cylinder engine would have a capacity per cylinder considerably in excess of many of our most successful small twins.

## Wearing Qualities.

As in motor cycle practice the stroke is seldom much greater than the bore, one might suggest 65 x 75 mm. as a suitable size for an 8-10 h.p. four-cylinder (capacity 996 c.c.). In all probability four cylinders will not be used for engines of less than 750 c.c., but even this size allows of a 60 mm. bore and a reasonable bore-stroke ratio. It will be remembered that many of our best light cars have a bore of no larger diameter, and the shortening of the stroke will not affect the size of moving parts other than beneficially. As a matter of fact, a four-cylinder engine should wear considerably better than a single or twin, as, apart from the question of steady impulse and absence of vibration, the four-cylinder design naturally lends itself to more reasonably proportioned bearing areas and improved lubrication. Improvements in these two points will to a certain extent do away with the necessity of constant tuning up, for which faulty lubrication is largely responsible.

The idea that a four-cylinder engine will have tiny valves which will give endless trouble is pure fallacy. A well-designed high-speed engine of 65 mm. bore will have a clear valve port somewhere in the neighbourhood of 32 mm. diameter, or roughly  $1\frac{5}{16}$  in., over the head. This is almost as large as the valves of the average  $3\frac{1}{2}$  h.p. single, so there should be no trouble on this score, especially as the lift would be comparatively small.

There remains the question of cooling, and this is simpler than it would seem at first sight. I would suggest an aluminium cylinder casting (possibly *monobloc*), and aluminium pistons working in thin steel liners. The *monobloc* casting certainly provides work for the foundryman, but if a detachable head is included in the design it is well within the bounds of possibility, and the cooling of the cylinders would be evened up and improved by long continuous ribs. While on the subject of metals, I would like to remind sceptical readers that this talk of aluminium for air-cooled cylinders and pistons, which has of late cropped up so frequently in the pages of *The Motor Cycle*, is not the idle talk of theorists, but a very sound and practical proposition, and I venture to prophesy that in a short time aluminium cylinders and pistons will be the rule and not the exception for motor cycles. The ensuing reduction in weight would be comparatively slight, but the improvement in cooling would be most important.

To return to the four-cylinder engine. It is long and is not easily disposed of in the present type of motor cycle frame. But have we reached finality in frame design? I think not by a long chalk.

## How the Cylinders may be Placed.

It is well to remember that to place the cylinders vertically in line is not the only possible arrangement

for a multi-cylinder engine. Leaving out the question of rotary engines, which do not seem easily adaptable to motor cycles, a four-cylinder horizontally-opposed engine, which would be lighter, cheaper, and more compact than the vertical type, is well within the power of our designers. A four-cylinder V-type engine was (and still is in car form) produced by a famous French firm, but both balance and even torque suffer in this design, though with care the difference can be made almost negligible.

Multi-cylinder engines must always be comparatively expensive to buy, and perhaps I shall be strafed for advocating a luxury campaign in these days. Yet there will always be a class who will buy the best, and this class is likely to be augmented in the near future by a number of car owners who can no longer afford the upkeep of a four-wheeler.

It is many years since I had my first ride on a four-cylinder "Binks," and many things have happened since those days. Magnetos, for instance, have removed one of the (then) difficulties in the way of four-cylinder motor cycles. I take my hat off to the modern F.N., the Henderson, and T.M.C., and in conclusion, to those who have not ridden a modern powerful four-cylinder I offer this advice. Try one!

UBIQUE.

Suggested design by "Ubique," writer of accompanying article, for a four-cylinder monobloc motor cycle engine.

## WOMEN MOTOR CYCLISTS ON THE LAND

### ANOTHER USEFUL WAR-TIME OCCUPATION FOR LADIES.

"**B**ACK to the land" is by no means a new cry, and, now the Forces are claiming the last eligible men from town and countryside, woman naturally is called upon to do all that she can to assist in the cultivation of crops. Two branches of farmwork that are especially practicable for women as giving both pleasure and profit are fruit and poultry farming. Situated in Mid-Herts are two such farms worked by enthusiastic lady motor cyclists. Mrs. Robb, an experienced rider of a 3½ h.p. Triumph, is a mistress of the intricacies of fruit and flower growing as well as of motor cycling. She is quite accustomed to taking long journeys on her machine, and the only drawback to her trusty Triumph that she finds is the height of the frame. This does not allow her to stand astride the machine when stopped by traffic. She wears an ordinary tweed skirt buttoned up the front, and considers the skirtless dresses advocated

is a work, too, that necessitates early rising, but is a most interesting and healthy occupation nevertheless. Attached to Mrs. Robb's fruit farm is a paddock containing about a hundred white leghorns. These were so nervous at the appearance of the camera that only a few of them remained to be photographed.

Miss Winifred Dunn is the other woman fruit farmer, one of a motoring family who has sampled many makes and whose stud comprises Douglas, Rudge, A.J.S. and a U. and I. sidcar, besides cars.

Miss W. Dunn pruning:

Miss Dunn's preference in a solo machine leans towards the Douglas, whilst for wet weather or carrying a passenger, she is quite enthusiastic about the U. and I. This young lady has five acres of fruit trees, chiefly apples, that she tends herself entirely.

The trees are the cordon variety, and when one observes the appearance of the gardens, with vegetables planted between the trees, and thinks of the time utilised every day in pruning,

Poultry feeding.

Mrs. R. Robb arrives on her Triumph at one of the greenhouses under her charge.

by some to be unnecessary. A small hat, long coat, and thick gloves constitute Mrs. Robb's motoring wardrobe.

One fact that this rider regrets is that the nice days of summer are those when the fruit claims one's closest attention; there is no spare time for tours of any length. It

Workmanlike costume worn by Miss Dunn when at work in her gardens.

digging, and clearing the ground, one feels that yet another female motor cyclist is "making good."

The garb chosen from experience by Miss Dunn, as one which is beyond improvement, can be seen in the illustrations. It is made of brown corded velvet with straps

**Women Motor Cyclists on the Land.—**

over the shoulders, and has a spacious patch pocket to contain a pruning knife and the storehouse key. At the skirt hem is a band of soft brown leather about 5in. or 6in. wide. The wearer thus escapes the discomfort of a soaked hem in wet weather. Then, below, workmanlike boots and leggings. It is as useless to try to work in unsuitable clothing as for the

lady motor cyclist to dress in the "about town" style when driving a machine.

These practical folk are highly amused at the illustrations published in the daily pictorial press of the woman farmhand in the spotless white linen apron. The apron would in a very short time lose all claim to cleanliness.

MAY WALKER.

**UNDER CANVAS AGAIN.**

With the coming of spring camps are springing up throughout the country, and the despatch riders in training are delighted to live under canvas. The photograph shows the dinner hour at an R.E. despatch riders' training centre.

**A VALUABLE PASTIME.**

The Advantage of a Smattering of Mechanical Knowledge.

**T**HERE is no doubt that the pastime of motor cycling has done much in adding to the general efficiency of the young men of this generation. Quite a small percentage of those serving with the Colours are motor cyclists in the sense that they have owned machines, but many thousands have been deeply interested in the pastime, and have possessed friends in whose mounts they have taken an interest.

In most cases this interest has been of no idle kind, and many youths whose friends or brothers own motor cycles have picked up for themselves the working of the machine, and learnt to effect ordinary running repairs. Such experience is invaluable, in that it creates an interest in mechanical things, and teaches one to sort out the why and the wherefore; whereas without any such experience, the average youth is quite content to regard machinery as beyond him.

There is no doubt that the youth with some mechanical knowledge, even though only a smattering, is calculated to prove more valuable as a soldier than those whose experience of such matters is of the tack and hammer variety, and this was particularly brought before my notice during a recent chat with a young

motor cyclist who, in charge of a machine gun, has seen much service since the outbreak of war. "My companions and I," he explained, "were interested in our gun simply because it was a machine, and but for our experience as motor cyclists, I don't suppose we should have had any particular affection for machinery. We had learnt as motor cyclists to set things right, and not to give up hope simply because some minor part had temporarily struck work." When stranded on a wet night, for instance, with a saturated high-tension wire, one has either to locate the trouble or suffer the discomfort of having to push.

The same thing applies out there, where one does not usually have to search far for trouble. The modern machine gun, though wonderfully reliable, requires a good deal of attention, and one's experience as a motor cyclist comes in useful when called upon to locate the cause of a temporary breakdown in the dark, and when the Huns are coming on in masses.

In such cases much may depend upon one's mechanical aptitude, and the motor cycle soon teaches one to put two and two together and carry out repairs more rapidly.

# QUESTIONS AND REPLIES

## Running on Acetylene Gas.

**[?]** Could you inform me if I should run any risk to myself or motor cycle by using acetylene gas for running?—J.W.

You would have great difficulty in fitting up an installation for running on acetylene gas. The explosion of this gas is very violent, being almost a detonation, and unless the engine was specially constructed to withstand these violent explosions, very serious damage might result.

## Erratic Running of Engine.

**[?]** I should be glad if you could assist me in locating the fault in my motor cycle. The machine will run on the stand for a minute or two, but then suddenly ceases to fire. I have checked the valve timing, which is correct; exhaust closes on top of stroke, inlet opens just after exhaust closes, each valve remains open one stroke of piston. I have cleaned carburetter, petrol pipe, and jet; these are quite clear. I get a regular spark at the plug points when the plug is placed on cylinder top and engine pedalled round. The spark is timed with piston on top dead centre, contact breaker nearly fully retarded. I have had the magneto to pieces and thoroughly cleaned it. The trouble commenced when on the road with the firing suddenly ceasing. Upon examination, I found that the insulation bush through which the central screw of the contact breaker passes was broken. I had this replaced, but am quite unable to get continuous running. I have tried different plugs, but after the minute or so running the engine stops. Could it be internal trouble in magneto?—T.G.

It is just possible that your trouble is caused by a broken wire connection in the armature of the magneto, though it is not a very likely cause of the trouble. The symptom rather points to shortage of petrol, perhaps due to partial stoppage of one of the carburetter passages. Make sure that there are no air leaks between the carburetter and the engine. Similar trouble to this is sometimes caused through air locks in the petrol tank, owing to there not being any means provided for air to enter. Make sure the rocker arm of the contact breaker is not sticking. If you suspect that the magneto is at fault we would advise you to send it to some firm of magneto specialists.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Shocks from Magneto.

**[?]** (1.) In the case of a car or motor bicycle the return circuit is formed through the frame of the machine itself, the gap at the plug points being the only interruption, and, moreover, all this circuit is insulated from the ground completely, or—nearly so, by the tyres. Why is it that while standing on the ground no shock is experienced when touching any part of the machine forming this circuit except from that part alone between the magneto and plug terminal? (2.) What are the respective voltages of the primary and secondary windings of a magneto at ordinary engine speeds?—J.B.

(1.) The reason that a shock is experienced if the high-tension terminal is touched, and yet if the frame, which forms the return circuit, is touched no shock is experienced, is that, owing to the resistance caused by the spark gap of the plug, the current, or a large portion of it, taking the easier path, passes through the person who touches the plug terminal, and so a shock is felt. If, however, the ground and tyres of the machine are dry, so as to form complete insulation between the person and machine, and the plug terminal only is touched, the shock then received is so slight as to be almost unnoticeable. The reason that no shock is received from the frame is that this offers such a large path for the return current that it is easier for the current simply to pass directly back to the magneto, so that no shock is felt. (2.) The primary current is roughly four to six volts, while the induced, or high-tension, current is roughly anything from 4,000 to 10,000 volts. It is usually taken that for each inch of high-tension spark 25,000 volts are required.

## Reversing an Engine.

**[?]** Is there any objection or harm done in reversing the running of engine and magneto? The engine is a 7 h.p. a.o.i.v. twin. Exhaust valve cam is exactly the same shape on both sides. The magneto is a Bosch.—H.J.B.

If your valve cam is exactly the same both sides you will be able to reverse the running by merely altering the timing so that the exhaust valve is open on what is at present either the firing or induction stroke, but in the case of the magneto you would need a new contact breaker.

## Warming the Carburetter.

**[?]** I use an 8 h.p. Matchless, and am thinking of fitting a hot air chamber to the carburetter for use with paraffin. (1.) Will you be good enough to inform me if it is necessary or advisable to place a gauze in the pipe from the exhaust in order to prevent any carbon or other impurities from entering the carburetter from the exhaust? (2.) Is there any danger in heating the carburetter by this means through the possibility of flame (such as sometimes comes from the silencer) igniting the spirit in the carburetter, or would there be any fear of spirit dripping down through the heating pipe into the exhaust pipe or silencer? (3.) Would it be better to connect up the silencer direct with the carburetter, or to drill a hole in the exhaust pipe and connect from there, and in the latter case, does it matter how far down from the cylinder this hole should be drilled?—R.A.

(1.) If you have a hot air chamber with a good sized outlet we do not think you will need any gauze in the pipe, as this would be likely to become obstructed, whereas if there is no gauze the deposit will form very gradually, and the chamber should go for a long time without needing cleaning. (2.) There is no danger in heating the carburetter by this means, especially if the chamber is properly made, and there is no connection between it and the carburetter itself. What you want to do is to heat the vaporising chamber. (3.) You connect your pipe to the heating chamber by any convenient means. It does not matter whether the connection is in the exhaust pipe or near the cylinders. It would be better, however, in the exhaust pipe, fairly near the exit from the cylinder, as the gas would not then have lost very much of its heat.

## PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always having their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

### Law relating to Cut-outs.

**?** Would you be good enough to give me through your columns a reading of the regulations which now prevail in England relating to exhaust boxes and cut-outs? The local law is unfortunately interpreted in such a way by the magistrates that the alleged offender stands no chance, with the result that a conviction is the invariable result. Our law reads: "Every motor vehicle shall be provided with an efficient silencer, and the silencer shall be in operation within the area of a local authority."—D.H. (Pretoria).

In England every motor cycle must be fitted with a silencer or expansion chamber suitable and sufficient for reducing, as far as possible, the noise of exhaust gases. It is made illegal to use any cut-out or other contrivance which would allow the gases to escape without first passing through such silencer or expansion chamber. In addition to this, however, the police can, under the common law, take proceedings against any rider whose machine, in the opinion of a police constable, is making more noise than is necessary.

### Running on Paraffin.

**?** In view of the high cost of petrol, I am trying to arrange a method of running my 4 h.p. A.J.S. and sidcar outfit on paraffin, and should be greatly obliged for your kind advice in this matter. My present carburetter is of the Amac multiple jet type, and with petrol I can get excellent results with a No. 26 jet and a consumption of 60-65 m.p.g. (1.) What is the greatest proportion of paraffin it is possible to mix with petrol and still get good results without the engine overheating, using petrol for starting? (2.) When using paraffin, is it advisable to use a smaller jet and weight the float? (3.) Would it be possible to run on paraffin alone if I connected a piece of flexible metallic tubing (as used for steam) of same bore as the exhaust pipe, and coiled it round the carburetter mixing chamber so that the latter is kept hot by the exhaust? (4.) With either of the above arrangements, is there liability to serious overheating of the engine if it is not forced? On one occasion I used a common grade of benzole without lowering the petrol level, as it did not seem necessary, the result being serious overheating.—J.W.R.

(1.) Fifty per cent. paraffin is about the greatest proportion with which reasonably good results can be obtained. (2.) We do not think you will find it necessary to reduce the size of the jet for this mixture. (3.) Yes; it is possible to run on paraffin alone, provided ample heating of the carburetter is arranged for, but the engine would run very hot, showing a very great tendency to knock, and would need cleaning out very frequently. We think you would get sufficient heat to warm the carburetter adequately if a by-pass of copper tube, say about  $\frac{1}{2}$  in. bore, were taken from the exhaust pipe and bound around the induction pipe and spray chamber of the carburetter, the other end then being conducted to the silencer. We think you would have difficulty in conducting the whole of the

exhaust gases to heat the carburetter, as you suggest. In addition to the heating apparatus suggested, we would advise you to draw all the main air for the carburetter from a point situated close to the exhaust pipe or cylinder, or from a special heating chamber fitted around the exhaust pipe. (4.) If you run on paraffin alone you would certainly find a considerable difference in the running heat of the engine, and it will be necessary to clean the latter out frequently. If your engine showed serious signs of overheating on benzole it will most certainly be more liable to do so on paraffin. To run on pure paraffin it will be necessary to start on petrol; then, when the engine is hot, the paraffin can take its place. It is possible to start on a half-and-half mixture

### Lack of Power.

**?** I have bought a 1914 second-hand lightweight fitted with a U.H. magneto and B. and B. carburetter. I have taken the engine down and ground the valves in, and I found every working part in perfect condition, but now I have put it all back the engine will run, but will not pull. I thought it must be my carburetter, but I borrowed one of the same make from a friend, but it gave no better results. The timing, I think, is correct; the exhaust valve closed just before the induction stroke, and I have timed it to fire when the piston is at the top of the compression stroke. It has fixed ignition.—E.S.

We should say that if you run the engine it will improve after a short time when the parts are run in. The spark timing seems rather late; try advancing it one tooth. Be sure that the valve caps are tight and that the compression is not leaking, also that the tappet clearance is correct.

An officer in British East Africa who, according to the message with the picture, "is enjoying his favourite paper, *The Motor Cycle*."

### Loss of Power.

**?** My machine is a  $3\frac{1}{2}$  h.p. Fafnir, fitted with an automatic inlet valve, B. and B. carburetter, jet 36, magneto ignition (Bosch), and a Roc two-speed gear—54 to 1 and 11 to 1. I get started well on low gear, and when I change into high the engine will not pick up. If I get a good start down a hill it will run well on the level on top, but coming to a slight hill it will commence to knock, and finally stop, whether I retard the spark or not. I can drive on full air no matter where the throttle is; if I use a smaller jet it misses fire. The spark seems good, and the compression is excellent. The inlet valve opens about  $\frac{3}{8}$  in., and when out of the engine I can open it with a jerk of the hand. The exhaust valve closes when the piston is at the top. The engine is free from carbon deposit, as it was recently cleaned. Would you please give me any information that might lead to the discovery of my trouble?—W.J.L.

It looks as though either the carburetter or inlet valve is at fault. You should not be able to give full air at all speeds. This indicates that you are getting too rich a mixture, which may be due to too large a jet, too wide a valve opening, or too weak an inlet valve spring. When testing the spring by jerking it on the hand it should not open easily. It should only be possible to open it slightly with a fairly hard jerk;  $\frac{1}{16}$  in. or  $\frac{3}{32}$  in. opening should be sufficient. A 32 jet should be about right. The carburetter should be adjusted so that rather more air than throttle opening is given at moderate speeds; but it should be possible to upset the firing by opening the air fully, except, perhaps, at full throttle. See that your magneto contact points are adjusted correctly, separating .4 mm., and that the rocker is not sticking. Make sure you are lubricating sufficiently.

# STARTLING IMPROVEMENT IN CARBURETTERS.

## The BINKS 1916 Automatic Jet Damping Pilot Jet Carburetter

"Heavy Petrol Consumption"  
 "Inflexibility"  
 "Won't run slow"

PRICE, 49/- WITH  
 SPARE JETS, KEY,  
 AND INSTRUCTIONS.  
 Plus 10% Advance.

Free advice  
 on all  
 Carburation  
 Troubles.

*I have  
 caught and  
 destroyed for  
 ever these pests  
 to Cycle Carists  
 and Motor Cyclists.*

**EQUALLY GOOD  
 FOR LIGHTWEIGHTS**

Mr. Edwards, a well-known actor, after having a BINKS fitted to his Bradbury by Mr. Chilton, wired to him on reaching London: GOD BLESS BINKS. A unique testimonial.

### One lever control

For all ordinary riding  
 especially in Traffic.

### Extra air lever

is there if you fancy it.

You can shut throttle and jets off  
 down hill and open air lever and  
 scavenge your engine with

**COOL, CLEAN AIR,**  
 and obtain good air brake.

You cannot do this with any other.

The results given by this new and wonderful instrument have to be seen by most to be believed. No other carburetter can approach it for slow running and flexibility and utmost speed, and it is by far the most economical carburetter in the world. Makes any engine tick over dead slow like a steam engine, and pull dead slow in traffic, and won't race when clutch is taken out, when running slow.

The **JET DAMPING SYSTEM**—The Secret of the extreme economy.  
 The **VARIABLE CHOKE TUBES**—The Secret of the marvellous flexibility.

## ON 3½ TRIUMPHS

AND ALL SIMILAR MACHINES

**150 MILES PER GALLON.**

**DEAD SLOW PULLING IN TRAFFIC,  
 JUST A TICK OVER WHEN FREE,  
 THE EXTREME LIMIT OF SPEED.**

## On 6 & 8 h.p. TWINS

WITH OR WITHOUT SIDECARS makes them run like small 4-cylinder cars (a remark actually made by a manufacturer on being shown a machine of this make fitted with a Binks). Revolutionizes the running and saves petrol and tyres.

Two of my competitors, who have up to now decried the pilot jet as unnecessary, are now adopting it, but the important point for you to consider is that they are copying abandoned ideas of mine!! A pilot jet that cannot be controlled from the handle-bar is practically useless. For the sake of the extra small cost it will pay you to buy the genuine article.

**RACING** Remember that the fastest time ever done on a T.T. machine, over 81 miles per hour, was done by Mr. O'DONOVAN on a NORTON with a BINKS CARBURETTER.

Send for Lists and  
 Treatise on Carburation

**C. BINKS, LTD., PHOENIX WORKS, ECCLES, Nr. MANCHESTER.**

Small spare tank to clip on frame to hold petrol for easy starting, 2-way tap, and pipe 15/- plus 10% war advance. You start instantly on petrol and at once turn the 2-way tap on to the cheap fuel; you cannot tell you are not running on petrol at 2/6 a gallon. You should lose no time in adopting this system, which reduces your petrol bill to one half.

In answering this advertisement it is desirable to mention "The Motor Cycle."

B31

## On the SCOTT

This instrument practically makes this truly magnificent machine run with steam engine like flexibility, absolutely dead slow when free or in traffic, gives it the *easiest* start and the extreme speed possible, yet with less petrol consumption than any other, and does not race when clutch is taken out. I have hundreds of wonderful testimonials about my 1914 carburetter on Scotts, but the new instrument is a *startling improvement* on last year's, giving far slower running and 25% more mileage. Can be fitted to the Scott, when the old carburetter is removed, by a novice in half an hour, with a spanner only. Absolutely no alteration or work required. To enable you to *TEST* my claims, and compare this instrument with others, I will send you one on a week's approval and *TRIAL*, and if you do not like it I will return your money. The Scott set consists of Carburetter, 49/-, new petrol pipe, connecting stirrup, clamp, bracket, and engine shields, to make all look neat and workmanlike, 15/-.

READ LETTER in "THE MOTOR CYCLE" ON AUGUST 21, PAGE 1091, FROM R. F. G. KELLY, ESQ.

**Testimonial (quite unsolicited) from Rev. O. D. Bryce-Payne.**

C. Binks, Ltd., St. Christopher's, Sandwich, Kent, 23rd September, 1913.  
 Dear Sirs—I have just finished 500 miles with your latest pattern carburetter fitted to my Scott. First, with regard to the fitting—if accessibility counts for anything it is admirable. Your carburetter went on without any tool being needed beyond a small spanner. It is the most *delightful* instrument to use. In conjunction with a Scott, traffic, originally a nightmare with a one-jet carburetter (automatic), which needed the united control of both hands and both feet, has no terrors, I can safely say, with a Binks two-jet. The extra air lever as a brake is especially useful.

Yours sincerely, O. D. BRUCE-PAYNE.

**Don't be put off by those makers who have contracted to fit cheap imitation Binks carburetters to all their 1916 machines**

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding 10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

### A.J.S.

**6** h.p. A.J.S., new November, 1915, and Mills-Fulford sidecar, only run 700 miles; offers.—Fletcher, High St., Tadcaster, Yorks. [X7331]

**A** J.S., 4h.p. twin, 1915, and coach sidecar, shop-soiled; reduced £75 to clear, bargain.—Campion Garage, London Rd., Derby. [3811]

**A** J.S., 4h.p. and sidecar, 1916 model, just delivered, 293/17, also 1916 2½h.p. model, £58.—Turpins, 22 and 29, Preston Rd., Brighton. [0716]

**A** J.S., 2½h.p., December, 1914, 2 speeds, handle clutch, kick starter, ridden very little; must sell; great bargain, £35.—Tarrington, Avonside, Evesham. [X6790]

**A** J.S. 1915 Combination, 6h.p., as new, usual spares, including spare wheel; nearest offer to £100.—F.R., 149, Kentish Town Rd., N.W. Phone: N. 26. [3682]

**A** J.S., 2½h.p., 1916, 3-speed, with all accessories, practically new, ridden under 500 miles; offer leaving for the Front.—Butler, 102, Hagley Rd., Edgbaston, Birmingham. [3669]

**A** J.S., late 1914, 6h.p., detachable wheel, mileage done about 5,000, with sidecar (very comfortable), with hood, side curtains, and wind screen; £60, or near offer.—Apply where can be seen, Stambam Cycle Depot, 57, Holborn Viaduct, London, E.C. [3947]

**A** J.S., 1914, 2½h.p., 3-speed, mechanically perfect, tank and frame, re-enamelled, very fast and powerful, Dunlop tyres, new back, pao saddle, Lucas horn, P. and H. lamp, really high-class machine; approval, deposit, £35, or near offer.—Kelman, Generating Station, Tidworth. [3647]

### Alcyon.

**A** LCYON, 2b.p., low, fast, new piston and back tyre, mag.; bargain, £11/10.—46, Cleveland St., Shrewsbury. [3852]

### Alldays.

**19** 15 Allon 2-speed; 32 gns.; perfect.—Troward, Heathurst, Vale of Health, Hampstead. [3834]

**A** LLDAYS Allon, all models; immediate delivery. easy terms 2% extra.—Referee Cycle Co., 332, High Holborn. [0763]

**19** 15 Allon, 2½h.p., 2-stroke, countershaft drive, all accessories; £24.—Wilkins, Boot Stores, High St., Edgware. [X7146]

**A** LLDAYS Matchless, 1914, 2-stroke, accessories, speedometer, new condition; £21.—Blomfield, Dereham, Norfolk. [3725]

**A** LLDAYS MATCHLESS, 2½h.p., 2-stroke, new condition, accessories, 110 m.p.g.; £21.—Write, New Lodge, Hyde Park, London. [3959]

**A** LLON, 1915½, 2-speed, Millers lamp, horn, spare cover, mileage 1,200, good as new; £30, lowest.—Sackett, St. Albans Rd., Woodford. [3813]

**A** LLON, 2-stroke, 2-speed, 2½h.p., new February, little used; bargain, £32, or exchange Sh.p. Indian.—C. Pritchett, 141, Merton Rd., Wimbledon. [3769]

**A** LLON—Special easy payments for these wonderful lightweight, immediate delivery.—Colmore Depot, London Agency, 44, Finsbury Payment, City, 121, High Rd., Kilburn. [3506]

**A** LLON, 1915½, 2½h.p., 2-speed, as new, P. and H. lamps, Stewart horn, extra heavy Dunlops; £36, or nearest; appointment.—Stanley House, Broadway, Bexley Heath. [3934]

## Armoured Cars and Sidecars.

**I**N the early part of the war armoured cars were largely used by the different belligerents, but later one seldom heard of any notable achievements of these vehicles.

They were regarded in many quarters as being too heavy and cumbersome, and offering too good a target for the enemy's guns; another point against them was their unwieldiness in a narrow road, *i.e.*, the inability to turn round in a short space of time in case of necessity, whilst the amount of room they occupied on roads thronged with troops and transports was often a real disadvantage.

After a time the handy and mobile sidecar outfit transporting a machine gun was pressed into the service of the British Army, the Army Council being largely influenced in their decision to adopt this light and rapid means of transporting a machine gun by its extreme mobility and the manner in which it could turn round in a narrow roadway without recourse to a reverse gear. Extensive use is being made of the Sidecar Machine Gun Batteries, though, of course, the trench warfare which has ruled on the Western front for some months past has not given the batteries an opportunity of shining. Now, again, as the result of certain deeds, the armoured car is coming into the limelight, and it is only natural that comparisons are being made between the sidecar and the motor car as a means of rapid transport for a machine gun. Whilst the ground clearance of the sidecar is possibly a disadvantage, contrariwise the lighter vehicle scores by reason of the fact that it is lower and offers a smaller target for hostile guns.

This point is particularly noticeable in the case of enemy aeroplanes overhead, as the more compact and comparatively unobtrusive sidecar is not only less attractive to eyes in the sky, but it may be hidden in a ditch in a moment or run under any small tree, hovel, or shelter which may be found. Likewise the engine is more economical with petrol and oil, and con-

sequently necessitates less elaborate arrangements for supplies than would be needed for cars with engines possessing petrol-eating proclivities. Motor vehicles in ditches are quite common in this war; a sidecar is quickly removed in the case of such a *contretemps* by reason of its comparatively light weight; a heavy car in a ditch, however, is a different proposition, and may necessitate special tackle and a gang of men being brought up. As to the question of management, the sidecar and car are equally easy to drive, but on account of the smaller space required the sidecar is less liable to damage. In reliability, too, there is little to choose, though the sidecar scores in the matter of attention necessary and the ease of repairs compared with a car when the time arrives for replacements to be fitted. The simple air-cooling system of the sidecar is far preferable and less trouble than any water-cooling system, as water is not obtainable in every field in the war zone, and consequently drivers are tempted not to drain the radiator, and thus risk cracks in the cylinders due to freezing. We have heard of scores of cases during the present war where negligence of this kind has led to new cylinders being required, and the cars being out of commission for some weeks as a result. Road damage, too, must be considered, the heavier the vehicle the greater the damage to the road surface; no one of experience ever blamed a sidecar for churning up binding material of any road. What is likely to prejudice the chances of the sidecar in its fight with the light armoured car is the tendency to overload. As every experienced motorist knows, overloading has spelt the disaster of many a promising design, and the mistake, conscious or unconscious, is all too common to-day. One would never dream of fitting a limousine body to a light touring car chassis. Consequently, the mistake of imposing weights upon a sidecar chassis far in excess of its carrying capacity should not be repeated, otherwise trouble will be bound to follow.

("Road Rider" desires to express his indebtedness to Mr. C. Brown, of Messrs. Brown and Barlow, for much of the following matter. Messrs. Brown and Barlow issue an invaluable booklet of two-stroke tips for users of their carburettors.)

#### The Sparking Plug.

Some two-stroke manufacturers and agents supply sparking plugs with very thin and spidery electrodes, similar to those used on many American cars equipped with crude oiling systems. The idea is that the points will become hot, burn off any surplus oil deposited on them, and so prevent stoppages, due to sooted plugs. These advantages are possibly procured in gentle driving on the level; but Nemesis arrives when the machine is pushed along fast on the flat or forced up a long hill. The long, slender points then become hot enough to fire the mixture, pre-ignition sets in, and the engine pulls up suddenly. Until long slender electrodes, proof against overheating, are manufactured, the best two-stroke plug is one with a central electrode long enough and thick enough to conduct the surplus heat up into the body of the plug. Users should remember that the plug points on a two-stroke are not exposed to the cooling effect of the incoming charges, as is the case on a four-stroke. Overheated plugs are probably the commonest of all two-stroke troubles.

#### Starting with Petroil Lubrication.

A larger jet than usual is required, as the jet has to pass the normal quantity of petrol as well as the lubricant. In addition, it pays to empty the float chamber before storing the machine after a run. If this is not done the petrol will probably evaporate during the night, leaving a sticky mass of oil at the foot of the chamber. When the next start is attempted this oil may clog the jet, but must in any case spoil the mixture. The float chamber can be emptied either by shutting the petrol tap a couple of hundred yards from the garage door (the distance is soon found by experiment) or by removing the drainscrew provided for the purpose (if any).

#### Adjustment of Drip Feeds.

Crank case suction acts on all two-stroke drip feeds, and is apt to render their

behaviour exasperating. An owner starts his machine, and spends the first quarter of a mile in setting the oil to drip at the rate advised by the manufacturers. Then he opens up his engine, and "scraps." The crank case suction was very high when he first started, as he was driving slowly while he set the drip, hence the oil flowed freely. When he gets going he opens his throttle, reduces the crank case suction, and the drip slows down; so he gets less oil just when he wants more oil. Drips should, therefore, be opened up very perceptibly for speed work and hill-climbing.

#### Sluggish Drip Feed when Starting.

Engine oil often drips very sluggishly until the machine has warmed up, especially on cold mornings. Should this occur the oil must be thinned, for which purpose petrol is good and paraffin is bad. Paraffin will merely render the mixture even dirtier than it is already, and cause grave risks of a sooted plug. Petrol, at the rate of a teacupful to a tank of oil, will thin the oil, evaporate on reaching the crank case, and slightly enrich the explosive mixture until it is used up. The correct number of spots per minute for engines up to 300 c.c. is from fifteen to twenty-five in slow driving (up to twenty miles per hour, as when passing through towns), and from twenty-five to fifty per minute when hill-climbing or speeding on the open road. A faint blue haze should be seen astern when the lubrication is in order, but this haze must not be overdone or four-stroking will result. Perhaps the simplest test, when the rider is in doubt, consists of momentarily opening the release valve, when a decidedly blue puff should be emitted from the silencer.

#### Running in a Two-stroke.

A two-stroke engine is the better for being gently driven and slightly over-oiled when it is new. After the first decarbonisation the engine should be thoroughly run in, and as soon as the bearings have been thus well bedded down the machine may be forced along in a fashion which very few four-strokes can stand. The maximum pace may not exceed 35 m.p.h., a speed which can, of course, be freely employed on many of the main roads. If the engine is well run in, and oiled at fifty drops per minute, the engine will stand this pace indef-

initely, unless the sparking plug overheats, when it will stop comparatively suddenly and start off again cheerfully in a few minutes when the plug points have cooled down.

#### Four-stroking.

This annoying habit is practically always due to incorrect mixture or over-lubrication. A weak mixture causes popping back in the carburettor. The other cure is to master the oiling system so that an accurate amount of oil can be given. Such mastery implies a little initial care in the adjustment of the drip, or in the handling of combined petrol and pump systems.

#### Sparking Plug Gap.

The sparking plug gap should be the widest on which the engine can be started, and run slowly, as there is always danger of a globule of oil shorting a narrow gap. The width of the gap will thus depend on the intensity of the spark given by the magneto at low speeds, and some imported magnetos are very poor instruments. A good magneto will stand a gap of  $\frac{1}{16}$  in., but perhaps a more usual gap will be in the neighbourhood of 1 mm. or thereabouts.

#### Petrol Consumption.

Messrs. Brown and Barlow state that it is impossible to lay down a standard consumption for baby two-strokes, as their experience shows it varies according to the design of the cylinder ports; part of each fresh charge is lost through the exhaust port, and the percentage may vary with the design and area of these ports. Two machines of different makes, but of the same cubical capacity, may vary by as much as 30% in petrol consumption, when each is adjusted by an expert and provided with the same make of carburettor. In estimating consumption under petrol lubrication, it should be remembered that only 80-90% of the tank capacity is occupied by petrol, the balance being oil. The consumption is therefore from 10% to 20% better than a casual judgment would indicate.

#### Slow Running.

The ignition of two-strokes is timed much earlier than that of four-strokes. To obtain really slow running the spark lever must always be retarded as far as possible.

BY

LION

**Caught!**

In a recent paragraph about filing distorted pistons true till they settled down, I was naughty enough to set a little trap for the quasi-experts, but my bag included some bigger fish than I expected. It is, of course, a botching method at best; but the warping of pistons with high-efficiency engines is such a sad nuisance that until recently this particular dodge was the standard tester's trick at more than one of the biggest and most successful Coventry factories. I thought if I described it without giving authorities some of the know-alls would deride; but this botcher's tip has been applied to a winning Senior T.T. machine before now, and, for all I know, the plan may still be in use.

**About Knocks.**

I always hold that the diagnosis of knocks is extremely difficult unless one has the engine in one's possession, or unless one is very intimately acquainted with the make of engine in question. However, since some readers persist in regarding me as an inspired solver of difficulties by letter post, despite my weekly failures, may I say that one great help in diagnosing a knock consists in knowing whether or not the knock is accompanied by loss of power? If a knock arises from something being bent or out of truth, there is always a more or less marked loss of power, because of the friction involved; if, on the other hand, a knock arises from something loose, the running may be normal so far as efficiency goes. At the present moment I am hopelessly baffled by a knock in one of my engines, but it does its work as merrily as ever.

**About Rear Lamps.**

I am surprised that we hear so little about tail lamps. Motor cyclists have sat down very tamely under this ordinance, and from the absence of grumbles I must suppose that most people are well satisfied with the ordinary patterns on sale. Frankly, I continue to hope for something better. With rigid frames, a rear lamp mounted on the carrier is hardly ideal, as carrier vibration is about 100% worse than the vibration at any other point, and the lamp has to be very heavily built and mounted; moreover, it sticks out inconveniently, and the tube to the Y-piece at the generator is untidy, and apt to get pinched by one's leg. I have uniformly employed a Hunt dry battery tail lamp all winter; I keep two or three of them going, and stick them on the various machines I ride. They go on easily enough, as the battery box has two little hooks which slip over the chain stay or stand leg, and a top hook and frame clip make all safe. But they are hardly ideal in point of attachment. The top hook has to fit on the rear fork tube, and is so short that if there is a sprocket or brake drum of fair diameter, the clip

does not clear; this happens with two of my present mounts. Then you have to slip the hooks over the stand leg, and your stand is practically put out of action. My idea is that we want tail lamps to fit on the off side chain stay; you can prevent them from shifting and save the enamel from scratches by winding insulating tape round the stay. Given this sort of attachment, the dry battery tail lamp is excellent, as its little bulb takes very little current indeed.

**In Favour of Silence.**

I have just spent a week in one of those rural districts where there are ten corners per mile, and every corner is a hairpin. It has provided me with my one and only argument in favour of a dead silent machine. An absolutely silent machine is a good thing in such a district, provided yours is the only sample in the neighbourhood; for you can then hear the other fellows approaching the corners round which it is impossible to see.

**Another Recantation.**

I retract all the harsh things I have said of chain drive in the past. I shall doubtless reassert them with all the old venom as soon as a chain jumps off and winds itself round the calf of my leg, or jams itself inside the back wheel spokes. But my latest police-bristler has a two-chain drive which is really as silky as a well bedded belt; and as I have to drive through a water-splash at the foot of a steepish hill twice a week, I appreciate it—*pro tem*.

**Details Count with Two-strokes.**

I recommend disgruntled two-stroke owners to study the tips published by "Road Rider" in this issue, which largely embody the testing experiences of a leading carburetter firm. I have read them in proof, and they suggest to me the huge importance of detail accuracy in managing a two-stroke. Getting the right sparking plug is threequarters of the battle; and as so many two-strokes will only take midget plugs, many riders are using obsolete plugs, which have lain long in garage stocks. The other quarter of success lies in extreme precision about oiling; and we all know how the average owner's one concern about oiling is to avoid under-oiling at any price. The four-stroke has created in his mind the false impression that over-oiling doesn't matter; whereas it causes a two-stroke to misfire abominably, and caulk up the top ring in its groove within 200 miles.

**Good Carburetters Not Wanted.**

As my readers know, I am a child in theoretic matters, and merely babble ignorantly of half comprehended experiences, so I must rest content to quote the following, and leave it to wiser heads to dissect

**Occasional Comments.—**

the information offered. A firm is anxious I should try its patent automatic carburetter. In the course of correspondence it offers the following remarks, which I am sure will interest many readers: "You are aware that on single-cylinder sidecar outfits, the inequality of the torque coupled with the heavy load makes it necessary as a rule to use high compression, in order to get sufficient power. The consequence is on picking up with a correct mixture there is on several makes a great tendency to knock—not through defective carburation, but for precisely the reverse cause—and on such engines a carburetter giving the perfect mixture is not so good as one which can on such occasions administer a 50% petrol overdose to suitably retard the flame rate" (purists will kindly note that the split infinitive is not mine!). At last I know why I never got such good results as Hugh Gibson did with the  $3\frac{1}{2}$  h.p. sidecar outfit. I tuned my carburetters not wisely but too well, and went in for perfect mixture. He threw economy to the winds, went in for spasmodic 50% overdoses of petrol, and miraculous hill-climbing.

**Kick-starting with Automatic Carburetters.**

I will supplement the above theory with some practical experience. One joy of the automatic carburetter is that you can kick start on it with the valve lifter down. If I have to wangle a kick-starter in conjunction with a valve-lifter, I am always seen at my clumsiest. I always let down the valve too late and waste my kicking on the desert air; or, alternatively, I drop the valve too soon, and get hoisted out of the saddle. But now that I am using an automatic carburetter, I kick-start against full compression, *à la* motor car starting

handle; by the older and cruder method, you flood your carburetter liberally, and get a steaming head of petrol vapour to cancel the surplus air being sucked in through the lifted exhaust valve. Anyhow, I know which I prefer.

**Four-speed Ratios.**

I was a trifle surprised on paper at the ratios selected by various designers of four-speed gear boxes recently to hand at the office; and my ideas on the subject still want

clearing up a little, so I ventilate the subject in the hopes of receiving a plausible pointer or two. Here is a series which approves itself to more than one designer within very narrow variations:  $4\frac{1}{2}$ ,  $5\frac{1}{2}$ ,  $9\frac{1}{2}$ , and  $13\frac{1}{2}$  (with a  $3\frac{1}{2}$  h.p. engine). Would you not say off hand, gentle reader, that the  $9\frac{1}{2}$  second-speed is on the low side, and would you not suggest something nearer 7 or  $7\frac{1}{2}$ ? Mind you, I have not formed any convictions as yet. The other ratios are obviously intelligible. You have your high fourth for blinding under nice conditions, and for quiet ticking downhill; you have your slightly lower third for adverse conditions of not too arduous a character, and it is just the

**STEERING FROM THE SIDECAR.**

Many attempts, resulting in varying degrees of success, have been made to arrange for the steering of a sidecar outfit from the sidecar. One of the most successful is that devised by George Brough and shown above. In this a car-type steering wheel is attached to a special bar, the other end of which is located at the top of the steering head. The brake and carburetter levers are arranged accessibly, and a comfortable driving position is the result.

want of this fractionally lower top which makes the three-speeder imperfect minus a Philipson pulley. And you have your precipice-crawler for A.C.U. trials, and special stunts. But  $9\frac{1}{2}$  is certainly an uncommonly low second speed. After all, any decent motor bicycle engine can perform miracles on a 7 or  $7\frac{1}{2}$  gear with a rush. I myself have made clean ascents of most of the fair test-hills on higher gears than that. Do any four-speeders care to weigh in with their ideas on a subject which is assuming some importance, as the number of our ratios increases?

## HILL-CLIMBING FORMULÆ.

Why "The Motor Cycle" Adopted and Popularised  $T^2$ .

**E**ARLY in 1911 it became increasingly evident that the formula devised by Prof. Callendar and adopted by the A.C.U. was by no means a satisfactory means of arriving at a figure of merit which should be even approximately correct. Speed had by that date increased very much all round, and it was, in consequence, more and more necessary to use a formula which took some cognisance of this fact. Again, riders had discovered that extra weight gave them a great advantage on formula, especially when combined with small capacity. So much so that if a powerful machine were to win it had to ascend the hill at an absolutely impossible rate of speed—in some cases over 60 m.p.h., and the speed on a hill is limited not only by the power of the machine and the skill of the rider, but by the nature of the hill itself.

As the power, required to overcome air resistance varies as the cube of the velocity, it was suggested by some that a formula which incorporated  $T$ ,  $T^3$  and some constant determined by the length and steepness of the hill should be adopted. This would give excellent results, but it seemed to us that it was unnecessarily complicated, and we felt that any formula which was to displace that in use would have to be equally, or nearly equally, simple.

### Attempts at a Better Formula.

This question was referred to in an article in *The Motor Cycle* of May 25th, 1911, and it was stated that a committee of the A.C.U. had been requested to find a better formula. Whether this committee ever found a better formula we have yet to hear. Two days later the Lincolnshire A.C. carried out a series of speed tests at Grimsthorpe Park, and on this occasion the formula which has since become known as

*The Motor Cycle* formula was used, viz.,  $\frac{C \times T^2}{W}$ . It must be remembered, however, that this was not a hill-climb but a speed trial on the level.

On June 8th, 1911, we published an interesting article on the subject by B, who suggested  $\frac{W}{CT} + \frac{K}{CT^3}$  K being a constant which would vary with the hill.

On August 17th of the same year a letter appeared from Mr. C. R. Churchward, of Norwood, South Australia, in which it was stated that his club had adopted the formula  $\frac{W}{C \times T^2}$  two or three years previously. To this club, therefore, belongs the credit of first using this formula, while in this country it was

first used, so far as we can ascertain, by the Lincolnshire A.C. in the event already referred to, and first used in an open hill-climb by the Streatham and District M.C.C. on September 30th, 1911. The latter club also claim to have used the formula in club events previously, but, while we do not dispute this claim, we are unable to confirm it or find out upon what date it was used. (In a hill-climb held on May 4th this club was using the A.C.U. formula.)

### Our Selected Formula.

In our issues for September 7th and 14th, 1911, after the Coventry and Warwickshire M.C. hill-climb, we went into the formula question rather fully and decided

to adopt and recommend the formula  $\frac{D^2 \times S \times T^2}{W}$

which is  $\frac{C \times T^2}{W}$  with the constant .7854 omitted (by

the way, we prefer to place  $W$  at the bottom as it simplifies calculation, and in this case the lowest figure wins). These articles produced an interesting correspondence in our pages, the adoption of  $T^{1.5}$  and  $T^{1.3}$  being among the suggestions put forward. Since this time, we have done much to popularise the formula as the simplest and most suitable for motor cycle events, with what success all motor cyclists know. Later, the Streatham club adopted a modification in the shape of a weight limit for each class, but we do not consider this to be an improvement, in the first place because we do not think it necessary, and in the second because on a single climb a machine entered in two or more classes might have a different figure of merit in each class. A careful study of the results in the Army and Navy Hill-climb held on September 25th, 1915, will, we think, confirm this opinion.

### The Origin of $T^2$ .

*The Motor Cycle* does not claim to have originated the formula, which is simply an adaptation of the A.C.U. formula with  $T^2$  substituted for  $T$ . The first part is undoubtedly due to Prof. Callendar, but there are several claimants to  $T^2$ ; for instance, the Streatham club claim to be the originators in 1911. Mr. Churchward says his club adopted it two or three years previously, i.e., in 1908 or 1909, but it was first suggested, so far as we can discover, on December 13th, 1906, in a discussion which followed a paper read by Prof. Archibald Sharp, B.Sc., A.M.I.C.E., before the members of the Auto Cycle Club, as it was known in those days, and the credit for its suggestion belongs to Mr. Horace M. Wyatt, a constant contributor to our pages. A report of this meeting may be found in *The Motor Cycle* of December 19th, 1906.

# NAVAL AND MILITARY NOTES.

## NEWS OF WELL-KNOWN AIRMAN

NEWS has been received that Mr. M. A. J. Orde, of the R.F.C., is now a prisoner of war in Germany. Orde, who is the son of Mr. Julian Orde, the R.A.C. secretary, and a well-known T.T. Rover rider before the war, was reported missing some few weeks ago.

## "THE PAPER THAT PERSISTENTLY PROPHESIED THE END OF THE YEAR."

THIS is printed at the top of the cover of the March number of *The Strafer*, a copy of which we have recently received. Good as was the previous number, this one is better. Both letterpress and sketches are really excellent, and we wish we had the space to give some extracts. However, the following must suffice:

Why did the leather clutch?

Because it saw the wheel tyred.

*The Strafer* is written and printed by men serving with an A.S.C. Ammunition Park attached to the G.H.Q., and the leading lights in the enterprise are to be congratulated.

## MORE RAZORS WANTED.

SOME of our readers may remember the appeal made some little time ago by Mr. Harry Smith, managing director of the Rover Company, for old razors. He has already sent 2,753 to the Master Cutler to be ground and sent to the troops, and now, owing to the appreciation by the War Office of the work and the steady growth of the Army, a fresh appeal is made. The Cutlers' Company have forwarded no fewer than 135,000 razors to the military authorities. Any reader having an old razor, chipped or rusty, should forward it to Mr. Harry Smith, the Rover Company, Ltd., Coventry, and he may rest assured that it will be appreciated and good use made of it.

R.E. DESPATCH RIDERS IN TRAINING SOMEWHERE IN THE SOUTH MIDLANDS.

From left to right, Cpls. Reynolds, Garrison, Shaw, Ryder, and Muggleton.

## AN AMERICAN VERSION OF DESPATCH RIDING.

AN American contemporary gives a very lurid account of the dangers to which D.R.'s are exposed when on duty. The account is that of a Boston boy who served as a D.R. with the Allies during the fighting around Ypres, and finishes by stating that "out of a corps of thirty-one riders, with whom Robinson started on duty at Ypres, only four were alive when he left." This statement gives a wholly exaggerated idea of the dangers to which motor cyclist despatch riders are subjected. Of one section which left for the Front early last year, only one man has been lost.

Several illustrations of Robinson are given purporting to be taken while on duty near Ypres. He is seen mounted on an Indian motor cycle which is fitted with a pillion seat. Rather an unusual type of mount for a D.R.

## THE WAYS OF DESPATCH RIDERS.

WRITING from France, Donald E. Parsons, A.S.C., M.T., says: "You know the W.D. Douglas has the two-speed gear box and no clutch. Well, I have seen riders of these mounts stop the road wheels and keep the engine running; then when they want to move off they paddle for a yard or so and slip in the low gear—still with the engine running. Of course, the rear tyre makes an excellent emergency clutch, but I don't envy the job our workshop staff-sergeant will have when the gear dogs do strip. It would make the designer weep, too, to see them drive on the exhaust valve. They ignore the throttle."

The practice referred to is not so damaging if only an expert is handling the machine. Provided the engine is revolving at the same speed as it would be when driving the machine, the dogs will engage without noise, and the drive will be taken up without shock. We have several times done this on this make when fitted with an automatic carburetter. It is similar to a practice sometimes carried out by expert car drivers, namely, descending a hill in neutral with the engine running. When the bottom is reached the driver casts his eye on the speedometer, and accelerates the engine to the point at which he thinks it would be running if it were driving the car; then, without releasing the clutch, he pulls the top speed lever over, and it engages with a gentle click or with no noise at all, and the drive is taken up absolutely without shock.

Some men of the Motor Machine Gun Section starting for a Saturday afternoon's run on their own machines. Reading from left to right, Gunners H. Ellocott (B.S.A.), G. Hall and H. Brown (B.S.A. sc.), C. A. Wells (Douglas), and A. Phillips (Norton). Quite a number of men of the M.M.G.S. have their own mounts at the training centre.

## LAKE VYRNWY.

### A PARADISE OF LONELINESS.

**A**T the touch of spring, when nature is awakening from its long winter slumber and all the land is glorious with the rich colouring of hedge and field and forest, visions rise and float before the mind of choice spots that have been visited in days gone by, and whose memory is an insistent call that is hard to resist when one knows that they are once again resplendent in the tints and virtues of the spring.

confidence; and if one have no reason to fear a long hard climb and a stiff descent with many intersecting water channels, then the run over this pass to Bala will be an exhilarating and rewarding one, affording, as it does, a visit to the rival lake of Bala.

The second pass that bears more south toward Llanymawddwy and Dolgelley is less patronised, and for obvious reasons. It is not impossible, but it

Among such haunts the lonely Vyrnwy Lake holds a high place. Lying, as it does, far from the common ways of tourist and traveller, with a wild barrier of ten miles of hills between its silent waters and the railway on the east, it is of necessity to a large extent the monopoly of the cyclist and the motorist; to the former the long gradients prove a burden, while to the latter they offer just that variation from the level roads that is so welcome in a long day's run.

Around the shores of Vyrnwy runs a roadway, with ideal surface and ever-changing scenery, making a circuit of eleven miles; while from the western head of the valley two roads run over the mountains, offering opportunity, to those who relish a climb and are not averse to difficulties, of escaping from the lake to other scenes of beauty that lie westward of the Berwyn Hills.

#### A Choice of Routes.

The Bala Pass, the easier of the two, once dreaded by the motorist because of its rough surface and trying gradients, is becoming increasingly familiar to the more ambitious riders now that power and reliability give

requires courage and a love of doing things. A brief trip over unrolled metal, a little manoeuvring round the corners of a farmyard, and an excursion along a narrow ditch would familiarise the motorist who desires to take this route with a somewhat exaggerated type of the road that is to be faced. A cycle stands a better chance of accomplishing the run than a light car or a car, for the narrowness of the road at parts forbids the passing of two vehicles. However, there is the way, and those who accomplish the climb will doubtless say that it is worth the cost.

#### Sport for Rod and Gun.

But Vyrnwy may be accepted as a resting-place whereby to spend a quiet holiday, and it possesses attractions and interest enough to fill the hours of many idle days. The fish in its waters await the rod and line, and possess a virtue of their own. The game, when the time is ripe, await the gun along the hills and moors, while the climber will find long and inspiring rambles over the Arran and the Berwyn mountains that will awaken an alarming appetite.

**ROUND ABOUT LAKE VYRNWY**  
 (Top left) The lake from the hotel.  
 (Top right) The pass to Bala.  
 (Centre) A distant peep of Lake Vyrnwy.  
 (Bottom) Another view of the Bala Pass.

### Lake Vyrnwy.

The great hotel high-placed above the lake gives generous hospitality, and has seen royalty within its walls. Its terrace affords a magnificent panoramic view of the lake and the hills and the setting sun.

It was the hand of man, inspired by the wisdom of man, that barred the progress of the little Vyrnwy stream as it sang its quiet song down this wild valley and compelled it to become a mighty flood, and the grey granite dam that has been thrown across the valley does not strike a discordant note in the scene,

but somehow falls into quiet harmony with the surrounding hills.

When long rains have flooded the lake beyond endurance, or when the westerly winds pile up the water toward the dam, the white torrent pouring into the valley far below is a majestic spectacle.

The motorist who delights in solitude and desires to vary the road with the scenery and pursuits of mountain, lake, and stream will find few places more suited to his needs than this lonely lake among the hills of Central Wales.

## THE LIGHT TWIN.

### AN IDEAL DOUBLE-PURPOSE MOUNT.

THERE is a 5 h.p. twin-cylinder American machine, the name of which would not be unknown to certain readers, which, I believe, represents a class of mount that will become enormously popular in this country. I have not ridden this particular production from the States, and the makers' handbook, though containing the usual number of adjectives and sunshine (or moonshine), is characteristically devoid of such facts as the practical rider looks for. There is, therefore, no mention as to the weight of the machine, but from a cursory glance it appears to me to be about the same weight as a P. and M. or a Sunbeam single, while it is quite solidly constructed and well designed.

The single-cylinder machine of  $3\frac{1}{2}$  h.p. or 4 h.p. has met with a certain degree of popularity for sidecar use owing, primarily to its comparative lightness, secondly to its economy, reliability, and to the fact that it is ideal for solo use when a sidecar is not required, but there is no doubt that two cylinders are better than one for passenger work of any kind. Driving a single-cylinder sidecar outfit is a monotonous business unless the sidecar be light and the engine in perfect trim, while a good handle-bar clutch and a freakishly low bottom gear are practical necessities. The double impulse and the even torque of the twin render it much better suited for passenger work, but at present the choice lies, with but few exceptions, between an unnecessarily heavy sidecar outfit or a  $3\frac{1}{2}$  h.p. touring mount with light sidecar attachment.

#### My Ideal.

With the enormous popularity of the sidecar, British manufacturers have concentrated their energies on the production of a special type of machine which, though admirable for sidecar use, possesses the great disadvantage that it is not suitable for solo use. The outfit—both the machine and the sidecar—is, moreover, a good deal heavier than the majority of sidecarists really require, the labour of backing it out of the shed and up the gravel path three or four times a day being unnecessarily strenuous; but at the same time they require a machine which will ride comfortably and capably through a long tour, or which, on occasions—domestic or otherwise—is ideal for solo use.

This double-purpose machine has not yet materialised. There are many light, strong, and comfortable sidecars produced, but there is a dearth of light and powerful British-made twins, possessing the essentials of a sidecar machine, to match them.

My ideas as to an ideal double-purpose mount, capable of serious touring and suitable for everyday use, are, briefly, as follow:

Weight, about 200 lb.

Engine, horizontal (preferably) twin; about 600 c.c.

Gear, three-speed countershaft.

Clutch, metal-to-metal multiple plate, handle-bar and pedal controlled.

Transmission, all chain, enclosed; shock absorber in rear sprocket.

H.M.B.

AN INTERESTING LINK WITH THE PAST ON THE MAIN COVENTRY-OXFORD ROAD

The Horse and Jockey Inn, between Long Itchington and Southam, that was originally an old mint house. There is a massive oak staircase inside, and many other reminders of bygone days.

# HILL-CLIMB FOR PUBLIC SCHOOL BOYS.

A much-discussed Wartime Event run off in Spite of Official Opposition.  
Thirty-two Competitors on Machines varying in Weight from 140 lb. to 375 lb.

Bertram Currie, Eton (2½ h.p. Allon), nearing the top of Snowhill, near Broadway.

**W**HAT was termed the Public Schools Motor Cycle "Championship" was run off on Wednesday last, the 12th inst., the venue being Snowhill, near Broadway, Worcestershire. The weather was far from propitious for the occasion, as rain fell heavily in the morning, and somewhat heavy showers were the order of the day.

Though it had been announced by the promoters of the gathering that there were nearly 150 entries for the event, only thirty-two competitors put in an appearance. Whether this was due to the action of the A.C.U. in questioning the advisability of holding such an event in these times—quite apart from the fact that no permit had been obtained—or whether it was due to the unfavourable weather, or a combination of the two, we cannot say, but nevertheless the event naturally lost much of its promised importance.

The A.C.U. contended that the holding of the event was in direct opposition to the overtures of Government departments, who are endeavouring to limit unnecessary motoring, the defence of the organisers being that, as the competition was only open to public school boys, it would be very instructive for them should they join the Royal Flying Corps, M.T., or other specialised branches of His Majesty's Forces, while the expense incurred would be infinitesimal.

## The Weighing Operations.

All machines were weighed at the foot of the hill. The lightest machine was the Baby Triumph, which turned the scale at 140 lb. It was ridden by D. H. Hulbert, Rossall School, and son of Mr. F. Hulbert, the well-known motor depart-

ment manager of the Triumph Co., who was also present as a spectator on a Triumph sidecar. The heaviest machine was the electrically-equipped Harley-Davidson, which, after causing the scale tripod and rope to collapse, finally recorded 375 lb.! The times were taken

by Messrs. W. H. Wells and F. W. Barnes. Quite a number of the competitors were attired in the uniform of their respective school's O.T.C.'s, which gave support to the promoters' arguments that the meeting was a desirable event, as it enabled competitors to

SCENE AT THE START, showing W. H. Dare, King Edward's (2½ h.p. Clyno), waiting for the word to go. It is a sign of the times that in this group there are only two men of military age.

**Hill-climb for Public School Boys.—**

keep up practice and maintain a knowledge of mechanics that would be beneficial hereafter when the contestants were old enough to join the Forces. The climb had been timed to commence at 2 p.m., but it was decided to give half an hour's grace to enable a few late comers to weigh in and be ready to start. The best climb in Class I.A was that of J. V. Prestwich, Harrow, son of Mr. J. A. Prestwich, the maker of J.A.P. engines. His little Calthorpe, fitted with a 2½ h.p. J.A.P. engine, though clearly not running at its best, made a good climb, and was fastest on time in this class. The performances were generally poor, all competitors making extremely bad starts; especially was this the case with the little two-strokes. The results, on time only, are:

1. J. V. Prestwich, Harrow (2½ Calthorpe-Jap).
2. C. L. Whalley, Malvern (2½ Levis).
3. J. Culner, King Edward's (2½ Ixion).

Class I.B, for machines under 300 c.c., but with variable gears, was somewhat disorganised at the start owing to two farm waggons coming up the hill, and several of the riders had to have second attempts in consequence; also several of the riders were uncertain where the climb ended, and stopped prematurely. They

were therefore allowed second attempts, and in all cases the second attempt was far and away better than the first. The star ascent in this class was undoubtedly that of D. H. Hulbert on the Baby Triumph, who got away in a most businesslike manner, while the clear hum of this engine was pleasing to hear. His was also probably the steadiest ascent of the day. Results on time:

1. D. H. Hulbert, Rossall (2½ Triumph).
2. R. Chatley, Highgate (2½ Allon).
3. R. D. Clive, Repton (2½ Triumph).
4. W. H. Dare, King Edward's (2½ Clyno).
5. J. L. Hadley, Marlborough (2½ Calthorpe).

In Class II.B, for machines between 300 and 350 c.c. with variable gears, out of twenty-three entries only six started—four Douglasses and two 2½ h.p. A.J.S.'s. Order of result on time:

1. G. Butcher, Bridgnorth (2½ A.J.S.).
2. A. Pitt, Lancing (2½ Douglas).
3. P. W. R. Kaye, Harrow (2½ Douglas).
4. R. A. Loch, Cheltenham (2½ Douglas).
5. T. H. Gladstone, Oundle (2½ Douglas).

Class III., for 500 c.c. machines.—Cubitt, on a 3½ h.p. Norton, was the first in this class, and, in spite of making a poor start, succeeded in making a splendid climb and getting fastest time of the day.

C. C. Bemrose (3½ h.p. N.U.T.) was the next to start, but his belt broke

before he passed the bottom timekeeper. He was allowed another attempt later, after effecting a repair, when he made a very creditable climb. Results:

1. \*W. P. Cubitt, Charterhouse (3½ Norton).
2. C. C. Bemrose, King William's (3½ N.U.T.).
3. W. B. Hughes, King Edward's (3½ Rex).
4. L. B. Blaxland, Shrewsbury (3½ Ivy).
5. J. E. Pugh, Shrewsbury (3½ Rudge).

\*Fastest time of the day.

In Class IV.A there were only two starters, viz., the two Harley-Davidsons, and it was expected it would be a big tussle between these two machines for fastest time of the day, but, owing to the atrocious state of the hill surface, the riders were unable to do more than make steady climbs. W. F. C. Powell (Rossall) proved to be the faster of the two. After the climb we had the pleasure of riding one of these machines up the hill, and, in spite of the beautifully smooth running engine, it would have taken a man with a nerve of iron to ride one of these heavy mounts at even quarter throttle on so bad a road surface.

**GENERAL OBSERVATIONS.**

It was interesting to contrast the performances of these lads and their way of handling their machines with that of

**SOME PROMINENT RIDERS AT THE PUBLIC SCHOOLS HILL-CLIMB.**

(Left) D. H. Hulbert, Rossall (Baby Triumph): fastest time in his class.

(Right) G. Heath, Cheltenham (3 h.p. Enfield).

(Left) W. P. Cubitt, Charterhouse (3½ h.p. Norton), fastest time of the day.

(Right) J. V. Prestwich, Harrow (2½ h.p. Calthorpe), fastest time in the class for two and four-stroke machines up to 300 c.c. with fixed gears.

**Hill-climb for Public School Boys.—**

old experienced riders in the good old hill-climbs of bygone days, and most made poor starts, probably due to over-anxiety, which was not allayed by the starter, who seemed to take great delight in hustling them.

Contrary to the experience of most hill-climbs, there seemed little enthusiasm among the competitors to know the results, and at the Lygon Arms Hotel in Broadway, when the results on time were announced, not more than five of the competitors were present to hear them.

T. V. West, of Cheltenham, now serving in the A.S.C., was present, having arrived on his little racing Calthorpe on which he was to have driven in the cancelled light car race in the Isle of Man. The little car was evidently intended more for speed than comfort.

The starter, W. Cooper, was very free with his advice to the competitors, who seemed unwilling to open the throttle and start off with a rush on the greasy road, telling them to "open the throttle wide and let the engine do the rest," but when later he tried the hill himself in the grease he did not appear quite so enthusiastic about the open throttle idea.

Generally speaking, with the exception of the Baby Triumph, the two-strokes did not make good climbs, all showing a great tendency to four and eight-stroke.

C. C. Bemrose, whose school is in the Isle of Man, told us that they have never been officially allowed to witness the T.T. races. He had, nevertheless, usually managed to get away somehow or other to see them.

Some of the thirty-two competitors. J. V. Prestwich, Harrow (2½ h.p. Calthorpe-Jap), is seen starting.

An interesting feature of the event was the number of sons of well-known men in the motor cycle trade who took part.

Snowhill is situated about a mile from Broadway; the road is almost straight, while the gradient is not unduly stiff even at the steepest point, which was

near the summit. The surface, though fairly smooth, was wet and slippery.

Evidently *The Times* representative was present! On Friday that journal referred to the event having been held on Thursday, and to the entry of "150 competitors, and about 40 schools were represented." Let us hope the Board of Trade officials were not misled.

## THE MOTOR CYCLE IN CHINA.

IN many parts of China motor cycles are still a novelty. Roads, or rather the lack of them, are, in the main, responsible for the comparative lack of progress. The following, however, is not an article dealing with the possibilities of the motor cycle trade in that part of the world, but a reproduction from a Shanghai paper of some impressions of motor cycling in North Kiangsu. It is such an amusing description that we reproduce the article in full and exactly as it appears in *The North China Daily News* of March 7th last:

"Within two years two men up here have got motor cycles. Above the line of Tsingkiangpu and Pengpu; rice is not cultivated, and the fields are not cut up by canals. Roads are possible, but not in repair. There are only paths for barrows and difficulties for carts. The single cycle which follows the barrow track runs easily and some excellent trips have been made. When the sidecar is attached many difficulties must be negotiated. The longest trip yet made in one day, with the sidecar attached, was from Hsuechowfu to Suchien, a distance of 80 English miles. It was against a driving, east wind;

which wind brought snow and rain in its train. The traveller in the ordinary vehicle must have been held up in a mud hovel without fire and without the food that he would like.

"The novelty of this arouses much excitement. Even the hares get jealous at this trespass on their domain of swiftness.

### HARE VERSUS MOTOR.

"We saw him hopping up to the road and preparing for the contest. The *gaudium certamenis* twined every muscle of his back. He proposed to race that ugly usurper with the ugly bark. He played the game. Chose a good piece of road, and started even. How lordly he felt as he took the lead, tossing off his course as if it were nothing. Gradually he drew away from us. So the driver changed to his fastest gear. Now it was 'nip and tuck.' His ears softly dipped and danced on his shoulders as he sped along. Applause put the last ounce of speed into his flying form. Yet the red monster was neck and neck, not gaining an inch! The driver then injected extra gasoline. The machine fairly lifted itself and bounded forward. In another moment the challenger must

be under the wheel; when he doubled, all the while going at top speed—and went off through the fields, taking slow high leaps, as if he were saying: 'You can run some, but you are not in my class yet.' He had fairly won. What man-made machine could take that turn at that speed and yet go off on an even keel?

"As one passes through the country the excitement among the towns and villages was phenomenal. It was not fright nor ill will. It was plain curiosity pure and simple.

"Drive into a village where every one is nursing arms in homes or tea shops. The streets bare, but for an occasional hawk or two. Drive out at the other side and look back. It is as if one had struck a hive of bees. They tumbled out in crowds, looking at the fleet visitor. One leaves the gate and street China-blue with people, to go ahead and surprise another town.

"Stop on the street for a moment and the crowds behind fall over those in front. After one or two trips it is an old story and they will only be excited at an aeroplane.

"The motor cycle is here to stay."

## TIMES TO LIGHT LAMPS.

(GREENWICH TIME)

April 20	...	7.31 p.m.
" 22	...	7.35 "
" 24	...	7.37 "
" 26	...	7.41 "

## Relief for Doctors.

Doctors of medicine, we are informed, will only be charged half the new motor vehicle taxes.

## Ineligibles as Testers.

Recently we published a request of a manufacturer for the names of experienced motor cyclists ineligible for service with the Army or Navy who could release eligible men as motor cycle testers. A number of replies were received, and the vacancies were quickly filled; in fact, there are names of ineligible motor cyclists over and above the requirements as outlined to us up to the present.

## Transferred to the R.F.C.

Sec.-Lt. F. M. C. Houghton, who was the originator of the successful services meetings held at Brooklands last year, and the writer of an article in *The Motor Cycle* of last week entitled "True Tales of Despatch Riders," is to be shortly transferred from the 25th Division Cyclists to the R.F.C., where he will receive his training as an observer, prior to taking his ticket.

## The Prohibition of Imports.

The Americans are naturally somewhat annoyed at the prohibition of the importation of motor cycles and parts into this country, but several of the leading makers assert that they anticipated it, and have in consequence large stocks at their English depots. This probably accounts for the large number of machines imported during the past month. Mr. Walter Davidson, of the Harley-Davidson Motor Co., says that the American market is in splendid shape this year, and will probably absorb all of the motor cycles all the American manufacturers can put out.

## Motorists and the Budget.

The Executive Committee of the Automobile Association, on behalf of 90,000 members, have communicated with the Chancellor of the Exchequer suggesting certain modifications with regard to the Budget proposals affecting motor vehicles. We think that a better case could have been put forward. For instance, no mention is made of tradesmen's vans or sidecarriers—in many cases the sole means of delivering goods since horses were requisitioned for the Army. It is suggested that the proposals in respect of the increased taxation of motor cycles are too drastic, and that any additions to the present taxes should be on the original basis.

In support of these suggestions, it is pointed out that many people are to-day using cars and motor cycles as a consequence of the war (many for utilitarian

CURRENT  
CHAT

purposes, e.g., doctors, surveyors, and other professional or business men), that as a result of the arrival of the motor car vast numbers of people are now spread over the countryside who were previously in towns, and that the only method by which they can get from their homes to railway stations or nearest towns is by means of motors.

It is also pointed out that almost every user of a car or motor cycle is already being heavily taxed for the benefit of the State by the extra duty on motor spirit, and that a recent census of many thousands of A.A. members shows that 58% of their mileage referred entirely to business or professional work, 16% to voluntary war work, and 26% to private work.

On behalf of motor cyclists, it is shown that in some cases lightweight machines would have a greater taxable value than those of a heavier character.

## The New Motor Cycle Taxes.

At a special meeting of the General Committee of the R.A.C. held on April 11th the following resolution was put forward by Mr. T. W. Loughborough, secretary of the Auto Cycle Union: That, in the opinion of this committee, the proposed scale of taxation of motor cycles is misleading and inequitable, and that every effort be exerted to secure an amendment to the proposals, and to urge the adoption of a scale of taxation for motor cycles which, whilst proportionate to the duties to be paid by car owners, will operate fairly as between motor cycle owners of varying means.

## SPECIAL FEATURES.

HILL-CLIMBING FORMULÆ.

TWO-STROKE TIPS.

ARMoured CARS AND SIDECARS.

## Motor Cyclists and the Air Service.

A. S. Jones, of the A.S.C., M.T., writes as follows on recent topics discussed in these columns: "As an A.S.C. man receiving 6s. per day, I believe it is unfair. I have offered to transfer to the Royal Flying Corps, which would automatically reduce my pay to 2s. a day, but the request has been refused."

## Prices of Second-hand Motor Cycles.

In times of peace the six weeks or so preceding Easter see greater activity in the second-hand market than at any other time of the year. Now this does not hold good. As a result of the calling up of the single men for the Army there is a good selection of second-hand mounts, it being quite common to see the words "Owner called up" at the end of an advertisement.

## Signs of Easter.

The number of requests for routes we have received during the past fortnight, though not so large as in peace times, is sufficient to indicate that many motor cyclists will be using their machines for lengthy runs during the Easter holiday. Men engaged on munitions are endeavouring to get a few days' relaxation, in the form of a long week-end tour, after the winter months of hard incessant work.

## Baker's Records.

The following is a list of records that Erwin G. Baker, the American rider of a Powerplus Indian, claims to have made during his visit to Australia:

Twenty-four hours: 1,028 mls. 30 yds.—world's road record.

Eighteen hours: 876 mls.—world's road record.

Twelve hours: 576 mls.—world's road record.

Six hours: 315 mls.—Australian road record.

Five hours: 266 mls.—Australian road record.

Four hours: 215 mls.—Australian road record.

Three hours: 163 mls.—Australian road record.

One thousand miles: 21h. 3m.—world's road and track record.

Five hundred miles: 9h. 58m.—world's road record.

Three hundred miles: 5h. 35m.—Australian road record.

Two hundred miles: 3h. 41m.—Australian road record.

Hobart to Launceston, road record, 123 miles: 2h. 37m.

Oahu Island record, 90 miles: 2h. 4m. 36s.

The last-named refers to a run made by Baker in the Hawaii Islands on his way home to the United States.

**Another War Easter.**

Two motor cycle events are announced for this Eastertide. Compare this with Easter, 1914!

**Touring Guides' War Bonus.**

All R.A.C. touring guides are to have a bonus of 2s. 6d. per week added to their wages until six months after the declaration of peace.

**Complaints at the Heavy Taxes.**

Dozens of letters have reached us from motor cyclists complaining of the hardships imposed by the new motor cycle taxes. A further selection of letters relating typical opinions are given on pages 386 and 388.

**Munition Workers.**

Most motor cyclist munition workers will have to be content with one extra day's outing this Easter as a relaxation from their labours. No doubt some thoughtless people would deprive them of this one day if they could have their way. Such people are usually the kind who visit theatres and picture palaces regularly.

**The Clearing House.**

The information concerning Reg. Samson, who is now at Salonika, published in our issue of April 6th, has resulted in a parcel being sent him from Birmingham. Some of our readers will recollect a concert organised by Birmingham motor cyclists some sixteen months ago, the money received being spent in gifts for Midland riders on active service. Some trouble was experienced afterwards in getting into touch with some well-known men who had joined His Majesty's forces upon the outbreak of war. One of these was Reg. Samson, who, as stated, has now his parcel en route.

**American Journals.**

On the subject of the prohibition of imported motor cycles, *Motor Cycling* and *Bicycling* (Chicago) writes as follows:

"While the ostensible object of the British Government is to prevent the spending of money for luxuries, it is pretty well understood on this side of the water that the British motor cycle manufacturers have 'put one over' on the British motor cycle-riding public. It has been noted that American motor cycles have been supplanting the home-made product in the affections of the riders across the pond, therefore the English manufacturers, whose machines are commandeered for war purposes, or whose factories are devoted solely now to the manufacturer of war munitions, got the Government to stop the importation of American machines to save the British after-the-war market. This is a dog-in-the-manger act."

This, of course, is absurd.

The same paper has lifted the greater part of a photograph which appeared in a recent issue of *The Motor Cycle*. The inscription under this fragment reads: "English motor cycle battery with motor cycle rifles as escort; the kind we need in this country." The usual courtesy with which one journal should acknowledge extracts from another also seems to be a crying need in the country which is too proud to fight, but not, it seems, too proud to "requisition."

**Another Motor Cyclist Airman.**

Another leading motor cyclist to join the Royal Flying Corps is Ivan B. Hart Davies, of Rugby. The End-to-end record holder obtained his pilot's certificate two or three years ago, and was recently granted a commission in the R.F.C.

**The Birmingham Open Trial.**

The number of entries for the above trial now total 53. We do not give the route, as the officials are anxious to keep this secret in order to obviate competitors annoying inhabitants en route by practising. We are, however, able to say that the lunch stop will be at the Plough Hotel, Cheltenham, and the route includes several well-known test hills. This trial is no slackers' trial, as one of the regulations of entry is

that no competitor may be a single eligible man. It is only open to ladies, service men, reserve men, munition workers, or those ineligible for military service. Full particulars and list of entries will be found on page 385.

**A Cheap Fuel.**

Next week's issue will contain an account of a careful test carried out with Binks fuel by one of our contributors, who experimented with much success on a 3½ h.p. P. and M.

**The Taxes—Good News.**

*The Motor Cycle* has received from the Chancellor of the Exchequer an acknowledgment of the letter published in our last issue, together with a promise that the scheme formulated by this journal shall receive consideration.

And he that will his health deny,  
Down among the dead men let him lie.—Dyer

# "THE MOTOR CYCLE" RECRUITING SECTION.

Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

**A**MONG last week's recruits was a good number of single men who had hitherto been engaged in reserved occupations, but now released for service.

During the past week two inspections of recruits were held, one at Coventry on Tuesday and the second at London on Saturday last. Those motor cyclists and car drivers accepted for the M.M.G.S. are shown hereunder:

Allistone, H., Kilburn.  
Ashworth, G. V. W., St. Anne's.  
Baker, P. W., King's Lynn.  
Barker, R., East Ham.  
Barnes, A., Woking.  
Battell, J. W., Hornsey.  
Beaton, G., Stockton-on-Tees.  
Birley, W., Hull.  
Bradley, T., Totley.  
Brown, P. H., Sudbury.  
Burton, H., Peterborough.  
Buttle, A., Ramsgate.  
Candy, M. C., Booter.  
Carrington, A. S., Atherstone.  
Cartwright, W. H., S. Kensington.  
Chackett, H. S., Canook.  
Clark, G., Rugby.  
Clarke, J. W., Acton.  
Chase, W., Forest Gate.  
Comet, W. L., Lodon.  
Cormack, A., Wick.  
Cutler, L. W., Sutton Coldfield.  
Dales, A., Mookseaton.  
Edwards, E. W., London.  
Evans, H. A., Bournemouth.  
Freeman, F., Lewisham.  
Fuok, J., Sheffield.  
Gales-Wise, A. J., Marske-by-the-Sea.  
Gibson, N. F. W., Melton Mowbray.  
Gill, J. H., Hebben Bridge.  
Harper, F., Wednesbury.  
Haykios, F. F., Gateshead-on-Tyee.  
Hahner, A., Beigate.  
Hever, C. M. J., Eynsford.  
Hibbert, H., Sutton-in-Ashfield.  
Hitchin, F., Birmingham.  
Hobbs, L., Woolhampton.  
Holmes, E. W., Castleton.  
Jago, J., Woking.  
Johnson, A. G., Liverpool.  
Kaye, C., Sheffield.  
Kilburn, G. R., Dewsbury.  
Lane, E. A., Stratford.  
Lawson, A. C., Muswell Hill.  
Leeding, E. H., Peterborough.  
Lymer, H., Leeds.  
Marshall, H., Kearsall.  
Marshall, J., Bradford.  
Marston, W. G., Coventry.  
Mayers, C., Chester.  
Medhurst, W. S., Chobham.  
Middlehurst, E. S., Guildford.  
Miles, J. J., Stockwell.  
Moakes, A. C., Merton.  
Mortimer, A., Bradford.  
Moss, T. R., Fleetwood.  
Moss, W., Poulton-le-Fylde.  
Murgatroyd, C., Leeds.  
Newton, J., Heaton Moor.  
North, F., Bourne.  
Offord, A. W., Royston.  
Orsbach, M., Hammersmith.  
Pearson, A. H., Oxford.  
Phillips, G. R., Briton Ferry.  
Plumb, A., Billericay.  
Potts, S. A., Carlisle.  
Pottinger, M. W., Wantage.  
Prior, H., Leeds.  
Rennison, W. P., Seaton Delaval.  
Richardson, W. R., Kentish Town.  
Rogers, E., Sherwood.  
Rooke, A. E., Braham-on-Crouch.  
Rosier, L. C., Coventry.  
Rowlands, H. H., Egreymont.  
Rutter, H. M., Cambridge.  
Smith, W., Cirencester.  
Sowerby, C. S., Waltham.  
Spearman, J. W., Windsor.  
Spooner, F., Canook.  
Stephenson, J. A., Bridlington.  
Taylor, F. H., Canonbury.  
Tasker, J. O., Norton-on-Tees.  
Thompson, R. K., S. Tottenham.  
Thomson, A. J., Dewsbury.  
Thomson, R., Newcastle-upon-Tyee.  
Thornhill, G. H., Derby.  
Torge, H. T., Bolton.

Townsend, C. E., Sutton-in-Ashfield.  
Tyrer, W. A., Liverpool.  
Way, S. J., Camberley.  
Weatherhead, J., Patchley Bridge.  
White, E. A., Tettenhall.  
Wilkinson, P. L., Keighley.  
Williamson, J. J., Liphook.  
Woodward, T. R., Oxford.  
Worrall, L. H., Halifax.  
Yeardley, H. M., Tadcaster.

This week's appointments for the examination of recruits were at Coventry on Tuesday and Bristol yesterday (Wednesday). Lieut. H. N. Smith, R.E., made the arrangements at Bristol.

For the benefit of prospective recruits in the M.M.G.S., a list of inspections arranged in the different districts are given below. Mr. Geoffrey Smith, the Editor of *The Motor Cycle*, who is in charge of recruiting for the Motor Machine Gun Service, will be in attendance to test applicants, and will issue War Office acceptances to suitable men. There is no necessity to write. Experienced car drivers and motor cyclists who conform to the requirements enumerated on this page may present themselves at any of the addresses given.

BRISTOL.—Victoria Rooms, opposite Queen's Hotel, Wednesday, April 19th, 2.30 to 4 p.m.

MANCHESTER.—Messrs. Iliffe and Sons, Ltd., Century Buildings, 199, Deansgate, Wednesday, April 26th, 2 to 4.30 p.m.

LONDON.—The Motor Cycle Offices, 20, Tudor Street, E.C., Saturday, April 29th, 1.30 to 4 p.m.

The terms of enlistment in the M.M.G.S. are:

Pay, 1s. 2½d. per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limits, 19 to 40.

Applicants must be medically fit for General Service abroad or for Garrison Service abroad.

Applications still reach the Editor from men who desire to join "in three months' time," one actually mentioning October! Such forms should not be submitted, as nothing can be done for any enquirer who is not in a position to join up promptly.

Monday morning's post brought 123 applications for enlistment and particulars of the Motor Machine Gun Service.

In the latest list of recruits are included further men who have been on the waiting list of the Royal Engineers' Signal Section for some months past. Owing to there being no vacancies these men had been notified to join another section.

The total number of applications dealt with by Mr. G. Smith from motor cyclists and car drivers anxious to enlist in one or other of the different motor sections of the Army since the outbreak of war has risen to 8,435.

HILL-CLIMBING COMPETITION FOR KHAKI-CLAD MOTOR CYCLISTS.  
Working out results of the impromptu hill-climb held on Friday last by the Inns of Court O.T.C. at Toms Hill, Aldbury

# Monday's Service and Munition Workers' Trial.

Over Fifty Entries for the Birmingham M.C.C. Easter Event.

OVER fifty entries have been received for the Easter Monday trial of the Birmingham Motor Cycle Club. The list is given below, and it may be taken as practically complete, though there may be a few more additions. We are informed that practically all the entrants are Service men; of the remainder, the majority are munition workers and Derby men who have not yet been called up. No single men eligible for service will ride.

Many well-known names will be recognised from the list, and the trial is being looked forward to, by competitors and officials alike, as an opportunity of meeting old friends in a congenial atmosphere.

We have had an opportunity of examining the route card. The total distance of 146 miles embraces six well-known

hills, and there are six non-stop sections. Starting from the top of Griffin's Hill, Selly Oak, Birmingham, at 9 a.m., the first man is due to arrive at the Plough Hotel, Cheltenham, for lunch at 12.50 p.m.

The Inns of Court O.T.C. Regimental Hill-climb, announced for Friday last, did not materialise in the form expected, an impromptu event only being held. This illustration shows a rider of a Douglas climbing Toms Hill, Aldbury, during the impromptu competition.

## AN EXPERIENCED RIDER IN FRANCE.

A CHATTY letter we have received from F. Turner Denton, who went out to France just over twelve months ago, contains points of interest to our readers. Denton has done an amount of despatch riding, and has more than a good word to say of the Douglas and Triumph machines. His more recent

experiences have been as instructor at a base M.T. depot. Here newcomers from home are put through a course of driving and riding under active service conditions before taking up their work in the war zone, and Denton has been teaching such men the handling of W.D. model three-speed twin-cylinder Clyno sidecar outfits

under conditions that never prevail at home.

He considers that the gruelling motor cycles get on active service and the continual practice the riders have on "impossible" roads will result in both vastly improved machines and more competent riders after the war.

# MOTOR CYCLE TAXATION.

## MORE READERS' OPINIONS OF THE INJUSTICE OF THE NEW TAXES.

Sir,—With regard to the proposed new taxes on motor cycles, does it not seem unjust that a man riding to work on an old machine—costing about £10—should be made to pay the same amount of taxation as the man with a £100 turnout?

Machines taxed according to their value or some kind of graded tax would be the only fair way.

Could not this matter be brought to the notice of Mr. McKenna?  
OLD STAGER.

Sir,—Having read with interest the articles and letters on the new taxation, may I state my own case?

I am a young business man, married eighteen months, in business six and a half years, worked up from nothing and without capital. A small branch line only connects the town by rail to the main line—useless for covering the district, as I often have to do on my photographic business. Traps are scarce and slow, and cost much to hire. In many cases my apparatus is too heavy to carry on a cycle, apart from the fact of arriving at my destination puffed and dusty. The only vehicle "hirable" is a car, which is to say the least expensive. In wartime we are told to economise, so I get a motor and sidecar. I have been plotting and scheming for it for months; it is the thing for my purpose, but ways and means did not allow until a few weeks back. Now, down comes the extra tax, and the probability is that I shall have to give up the machine. Yet the fact remains. I buy a mount, for business purposes, second-hand at £26 (and no easy matter then), and have to pay the same tax as a man who buys an expensive outfit of same horse-power at £80 to £100, and of the two, who is likely to do more pleasure riding?

No, I certainly agree with your other readers (and there are many in my position); a practical man was *not* consulted in drawing up this Budget!—or part of it.

### BUSINESS 'FORE PLEASURE.

Sir,—I, as one who will be hard hit by the tax, and own a motor cycle for getting out in the open at the weekend, should like to say a word or two on behalf of working men who have invested their money in motor cycles. I think that the best way to raise money is to put a tax on all spirit or petrol used for propulsion. Thus all who travel on the highway will pay their fair share, and not hide under the cloak of business and commercial use. Those that travel most will pay most. I, like many others that I know, will have to store my mount, for I cannot afford to pay this extra tax. I think that you might print a protest form in your paper so that we could fill it up and send it to Mr. McKenna.

### WEEK-ENDS.

Sir,—I am glad to see *The Motor Cycle* has seriously taken up the matter of excessive taxation on motor cycles, and I beg to thank you as a motor cyclist of many years' standing. The taxes as proposed are nothing less than an imposition, and they must put a damper on motor cycling, which is certainly wrong. What sport and industry have furnished flying men, A.S.C. and M.M.G. units with material such as has been recruited from us? How many men knew they had any mechanical proclivities until they handled a motor cycle? Surely this excessive taxation must kill the goose that lays the golden eggs. £2 2s. as a minimum is out of all reason, as hundreds of machines change hands at £10, and it is with this machine that the novice learns more in two months than he would in two years with an up-to-date machine.

A case in point. I was about to purchase a machine for my son (aged 17), so that when he has to "join up" he may qualify for the R.F.C. or D.R.'s. The new taxation, however, has put this quite out of the question, as I cannot submit to a 3 guineas tax on a £10 machine, although I claim to be patriotic.

Why the pedal cycle should not bear some of the burden I cannot understand. We possess three in our family, and would not object to a reasonable tax on them.

In conclusion, what industry is doing more for the country than the motor cycle makers? A record will no doubt be available some day of the amount and quality

of the munitions made by them, which work they are doing wholeheartedly, the while they have seen their business simply walked into and picked up by our *soi-disant* American cousins, gratis.  
JOHN J. LEONARD.

Sir,—I have read your letter to Mr. McKenna in last week's *Motor Cycle*. In my opinion £4 14s. 6d. is too much for any motor cycle, no matter what size the engine, and with or without a sidecar. £1 in peace time and £2 in war time is ample. Perhaps you remember it was proposed to increase the taxation some three years ago, but after investigation the matter was dropped. The rich man has his tax trebled, the poor man with a motor cycle of 8 h.p. quintupled nearly. Why?

Take my own case. I have an 8 h.p. machine and sidecar six years old. I bought it four years ago for £55. My running expenses, excluding depreciation, are about £10 per annum. Although my income is over £400 per annum, I cannot afford anything like £4 14s. 6d. tax, especially with petrol so dear. I do practically all my own repairs. My machine never goes to a garage. My ability to pay tax can be measured by the amount I can afford to spend, viz., £10. I cannot afford any more.

Why should expensive pianos, horse keepers for pleasure, etc., be untaxed, and a man who can afford a miserable £10 only per annum on recreation for three people be charged five times? In fact, why should he be taxed any more? Increase in income tax and cost of living is quite enough. Ten shillings for Auto-wheels, £1 for nominal 3½ h.p., £1 10s. for 6 h.p., and £2 for 8 h.p. is quite enough.

### INDIGNANT.

Sir,—It is not often I take up my pen to write to a paper, but I feel I certainly must do so now. May I quote my case?

Before war broke out I was a Territorial, and on mobilisation I immediately, with the greater majority of my pals, volunteered for active service. Within three months of the outbreak of war the battalion was in France fighting at Ypres. After three months' fighting I was unfortunate enough to try conclusions with a shrapnel shell, the latter coming off an easy first, and the next ten months I spent in hospital, where my leg was just saved from amputation. The nett result is that I am lame, if not for the rest of my life, certainly for the next twenty years.

Now comes the grateful country's return. I could have taken my discharge from hospital as permanently unfit, but feeling I could still do a little more, and possibly free a fit man for service abroad, I made application to be kept on, and was then sent here to the second line. I can walk, roughly, one mile; possibly two. The camp is three or four miles from anywhere, in a very hilly country, where it would be practically impossible for me to get out far, much less to the station five miles away, were it not for the fact that with the small amount of money that I had managed to save for a machine in pre-war days and the money due to me on my discharge from hospital I managed to get a small 2½ h.p. two-stroke machine (second-hand) with which to potter around a bit, and, incidentally, get a little fresh air now and then. By the way, is this pleasure motor-ing? With everything going up, bar our shilling a day (although I freely admit I get a little more than that), it made things rather difficult to manage, what with £1 Inland Revenue licences, 5s. driving licence, petrol (when obtainable) 2s. 7d. per gallon—more if the retailers could get it—I could not afford to insure.

Still, things were not so bad, and we were not grumbling until the kind Chancellor of the Exchequer saw fit to more than double our taxes, making the wounded Tommy's baby machine pay, comparatively, twice as much as the "millionaire's 60 h.p. car"!

I trust you will excuse this lengthy effusion, but I feel rather strongly on the matter, and I am certain there are many others in the same position as myself, and if matters keep on as they are we shall soon have indefinite "C.B." as it will be impossible to keep our machines. I speak more or less, from actual experience, as there are several others in this camp alone.  
LANCÉ-CORPORAL.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

A well-made pair of riding gauntlets sold by Grose, Ltd.

## MOTOR CYCLE DESIGN IN 1885.

THE ancient motor bicycle illustrated was built by Gottlieb Daimler in 1885, and was the forerunner of all road vehicles propelled by internal combustion engines. The original idea of an explosion motor occurred to Philippe Lebon, but nothing much was done until another Frenchman, Lenoir, actually built a gas engine in 1861. Then no more was done until Daimler built his first motor bicycle. It is interesting to note how the machine follows the form of the early bone-shaker, and yet is modern, in that it has a vertical engine and belt drive with two speeds.

We wish to thank a Swiss reader, M. Bense, of St. Gall, for sending us the original.

A MOTOR CYCLE OF 1885.

An extremely quaint, compared with present-day ideas, design of Gottlieb Daimler.

A. Engine. B. Carburetter. C. Exhaust box. D. Exhaust pipe.  
E. Saddle. M.N.K. Belt transmission. H.O.P. Brake mechanism.

## USEFUL GAUNTLETS.

WE have lately examined a pair of motor cyclists' gauntlets, which are the idea of Mr. H. G. Grose, of James Grose, Ltd., 4, Old Jewry, Cheapside, E.C. The palms are of thick leather, and spaces are provided for the thumb and first finger. The lining is of lamb's wool. The upper part of the thumb, the joint between the fingers, and a portion of the lower part of the wrist is composed of soft leather, so as to render the gauntlets flexible. The back of the glove is made of heavy waterproof twill, as is also the part extending over the wrist and some distance up the arm, the latter being stiffened by means of pieces of cane.

## ADAPTABLE DESPATCH RIDERS.

THE following is an extract from an amusing letter we have received from four R.E. despatch riders in training in the Midlands, and who have been assisting G.P.O. authorities in restoring telegraphic and telephone communication:

"After one week enduring the drill-sergeant's gnash our squad was passed as proficient in foot drill, and we are now detailed in groups to assist the postal and railway officials in restoring and repairing the wires and lines destroyed in the recent blizzard. Our work is seven days a week, from early morn to dewy eve, and we are as happy as crickets. We act as labourers to the more skilled men. The work is, as pointed out by our regimental sergeant-major, of the utmost national importance, and, although very laborious and at times monotonous and irksome, our high spirits have never yet failed us.

"Instead of motor cycles we handle the pick and spade, and our control wires are not of the approved Bowden type, but large drums of thick gauge copper telegraph line. There is not a man in the squad that would accept his discharge even with £100 bounty.

"Our squad 'nut,' who boasted lily-white hands and beautifully manicured nails, now has hands which might grace those of a life-long navy."

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Paraffin as a Fuel.

Sir,—After reading the letter by "FE 535" in your issue of March 30th on "Paraffin," I feel it would be of great interest to the community at large if he would give rather fuller details of his instrument, which gives all the advantages he claims, as in these times, when petrol is difficult to obtain at any price, and is getting steadily worse in quality in spite of rising price, a substitute fuel is particularly acceptable.

EO 293.

#### Some Firm.

Sir,—Noticing an engine thump of increasing magnitude in my 1915-16 Enfield, I took the machine to Enfields, Holborn Viaduct, and suggested it might be gear trouble, whereupon the company agreed to locate the fault and let me have the machine within two hours. Calling back ten minutes under this period, I found the last nut just being tightened.

But this is the wonderful part of the affair. It was not the gear at all, but a side bush in the crank case that had gone. So it amounts to this: My engine had been totally dismantled, new side bush fitted, and re-assembled ready to drive away in 1h. 55m., as agreed. To the very efficient mechanics at the Enfield London depot I take off my hat; to the firm, my very best thanks.

D. E. TURNER.

#### Top Feed Carburetters.

Sir,—I am surprised to read that such an expert motorist as Capt. Lindsay should, apparently in haste, jump to such a wrong conclusion from the evidence he mentions and unfairly condemn top-feed chambers off hand. Surely the correct inference to be drawn is that by the time he had ridden the first fifty miles or so most of the dirt and odd debris, which is almost invariably to be found in the tank of every new machine, had come down through the petrol pipe, and consequently he had no trouble with the bottom-feed instrument, *not* because the design and working are better, *but* because the source of the trouble had been removed. If the bottom-feed instrument had been on in the first place exactly the same trouble would have occurred, assuming, of course, that the gauze area was the same in both instruments, as, of course, a large gauze is much better than a small one; but the discussion is not as to whether a filter should be fitted or not—in the writer's opinion a suitable large area petrol strainer should always be fitted between the carburetter and the petrol tank—but as to advantages and disadvantages of feeding the petrol in at the top or bottom.

TOP FEED.

#### Motor Cycle Taxation.

Sir,—I am greatly interested in the proposed new taxes on motor cycles, outlined in your last issue. I suppose it means that the owner of a featherweight twin will in future have to pay a tax of over £3 per annum. Such machines are usually, as you know, the property of the person of limited means, who chooses his machine with a view to economy in petrol, tyres, and first cost.

On the whole, I think machines of, say, under 70 mm. bore should not be taxed more than at present, as I believe the Exchequer will lose more than it will gain by it. The

man with the light purse will scrap his machine in most cases rather than pay over £3, no matter how patriotic he may be. Three owners of lightweights to whom I have spoken on the subject say they intend to give up motor cycling, as they cannot pay the tax.

JOHN MACALLISTER.

Sir,—I think a great many of your readers will read with interest the comments in *The Motor Cycle* on the new taxes affecting higher power machines. The big jump from £1 to £3 3s. on a 6 h.p. machine, taken in conjunction with the high prices now prevailing for fuel, is going to tell particularly hardly on those small tradesmen who are purchasing their machines by the hire-purchase system and who already have been hard hit by the war and have the greatest difficulty in keeping up their payments. *Double* the tax (to my mind) should have satisfied the most rapacious Chancellor.

SIX HORSE.

Sir,—As a constant reader of your valuable paper, *The Motor Cycle*, I venture to enquire whether the attention of the "powers that be" has been drawn to the unhappy position of the owners of "sporting" motor cycles under the proposed new taxation.

I refer to the enormously increased tax on machines of over 4 h.p. The authorities have apparently overlooked the fact that there are a number of motor cycles in use of over 4 h.p. to which it is impracticable, if not impossible, to attach a sidecar, but whose owners will have to pay the tax which is presumably intended for the owners of the modern luxurious "family outfits."

In my case I own a "sporting" twin of nearly 1,000 c.c., which has no gears, or even clutch. Such a machine is quite unsuited for sidecar work, but makes a splendid solo mount for a skilled country rider in a hilly district.

It seems unjust that A will have to pay 25% higher tax for his well-worn solo machine than B, who owns a £90 6 h.p. sidecar outfit, and still more so if A uses his machine solely as a necessary means of accomplishing unavoidable journeys in difficult country.

A.R.V.B.

Sir,—As I live miles away from anywhere, and in a very hilly county, anything of less power than 6 or 8 h.p. is no good to me. My machine is indispensable to me, but on account of the prices and scarcity of petrol, etc., I have to use it as little as possible. My present annual mileage being quite small, the cost of running per mile under the new tax will probably work out from 4d. to 6d. Surely an increase of tax from £1 to £3 would be ample, the same as the high-powered cars.

Trusting that the motor cycle associations will take the matter up,

HERMIT EMPLOYED UNDER GOVERNMENT.

Sir,—In view of the proposed increased taxation on motors, a point occurs to me that may be of general interest. It may perhaps be most easily put by taking my own case.

My machine is a 2½ h.p. Douglas, and if, as appears likely, it will have to bear a tax of £3 3s., it would be more than I would feel justified in spending in such a way at the present

time. Will discontinuing the use of the cycle, or if need be getting rid of it, free me from payment of the additional tax when it is demanded this year? [Yes. See page 350 of our last issue.—ED.]

Further, under the old tax I was granted a licence which only expires at the end of the year. When the powers that be go back on their word, so to speak, and cut down the time by almost one-half, are we not, in fairness, entitled to a rebate on the original payment?

The point at issue in this particular case is of no great moment, but it may well be so to many users of the more powerful outfits, and especially so to car users.

ESELLE.

Sir,—It appears that makers must now bestir themselves to provide engines which will escape as much taxation as possible. Cylinder bore must not exceed 80 mm., so a long stroke is required to give the necessary cubic capacity. I suggest 80 × 120 mm. as very suitable dimensions for the usual medium power sidecar outfit, giving a capacity of about 600 c.c. The tax would be £2 2s. Incidentally, Nortons fit in rather well with their 79 × 100 mm. and 82 × 120 mm. engines. The latter could, no doubt, easily be turned out bored 2 mm. less. Perhaps machines already in use could have a liner fitted to the cylinder, reducing the bore to 80 mm. As the valves remain the same, the loss of power will not be too great, e.g., my 1913 James is 86 × 96 mm., giving 558 c.c., and would become 80 × 96 mm., giving 483 c.c.

W. R. DEUCHAR.

#### Handle-bar Clutches.

Sir,—I quite agree with "Ixion" that a stiff handle-bar clutch leaves something to be desired, but for my own use I would prefer a handle-bar clutch of poor leverage to a foot pedal of the everyday kind.

"Ixion's" comments on my notes refer particularly to the handle-bar clutch on heavy solo mounts, and his objection is that the effort required to disengage a handle-bar clutch of bad leverage causes a temporary derangement in the steering. To be truly judicial, however, we must not point out a common weakness in one system without contemplating the counterbalancing weaknesses of the other, and the ignorance many manufacturers display in the arrangement of clutch pedals far outweighs their "ignorance as to the simplest laws of leverage" as exemplified in the design of handle-bar clutches. On three machines I have recently ridden it was necessary completely to remove one's foot from the rests in order to manipulate the clutch, and this sort of thing interferes with the steering far more considerably than the act of hauling out a stiff handle-bar clutch. If, indeed, the handle-bars are of the semi-T.T. type, a bad spill or bruised knee cap may result.

"Ixion's" remarks lead me to wonder whether he has ever visited these northern hills since trials ceased, and whether he ever threads an intricate way through the traffic of Birmingham or London on any mount more formidable than his baby two-stroke. If he were half so familiar with mountain roads, closed gates, and greasy city sets as I am he would vote for any old handle-bar clutch rather than one of the pedal variety. Stopping and starting in dense traffic is, in my opinion, a most tricky business when one is dependent on a foot clutch. While stationary one foot must be kept on the pedal, the other being placed on the ground for support, and when it comes to moving slowly forward again the merest wobble in the wrong direction compels the rider to remove his foot from the pedal to regain balance, and the result of the clutch going in with a "wallop" is usually embarrassing. In starting off on a steep gradient the same applies, and it is in starting on hills and in traffic that clutch control is most valuable.

Therefore, whilst appreciating "Ixion's" criticism, I contend that the slight temporary derangement in the steering to which he objects is far more commonly experienced through badly designed pedal control than it is through badly designed handle-bar control, and, granted that there are "duds" in both instances, I further contend that the pedal system entails such enormous disadvantages (particularly in the case of the heavy solo mount) that the handle-bar system is generally to be preferred.

H. M. BATTEN.

#### An Enthusiastic Family.

Sir,—I thought that perhaps these two photographs, which were taken last August, might be interesting to the readers of that really top-hole journal, *The Motor Cycle*.

Prior to the war, and before I joined the Artists', I was one of that army of men whose sole delight is to have an engine under them, and these ladies—two of whom are my aunts and one my sister—were as keen as myself. For the time being we have temporarily abandoned motor cycling owing to the war. Meanwhile we are all looking forward to that day when we will be able to resume our favourite pastime. The old 'bus also awaits the day on its stands and loaded with grease.

In conclusion, I may say that I got the old 'bus in July, and ran it continuously till the end of November without the least trouble or involuntary stop, except a few punctures. My mileage was over 6,000. The motor cycle has still the original tyres, plugs, etc., and its consumption was 65-70 miles per gallon.

I am also one of the upholders of the grip control. I think there is nothing like it, and that it should be adopted as standard.

DENIS R. MULLAN (Cadet, Artists' Rifles).

The 7-9 h.p. 1915 Indian and sidecar referred to in the letter on this page from Cadet Denis R. Mullan.

### Voltage at Sparking Plug Points.

Sir,—In *The Motor Cycle* of March 30th, under "Questions and Replies," "J.G." asks about the voltage at the points of the sparking plug, and your reply gives a figure of 8,000 to 12,000 volts. No very accurate figure can be given, as the voltage varies owing to a number of different causes, but we should consider your figure rather high, and would suggest about 5,000 volts as being more roughly correct. As this question may be of interest to several of your readers, we give below our reason for suggesting this figure.

It has been found experimentally that at atmospheric pressure it requires 33,000 volts to jump a spark gap of one centimetre between polished brass balls one centimetre in diameter, and also that within limits the necessary voltage varies in direct proportion to the length of the spark gap. If smaller knobs are used, a slightly less voltage is required to jump the spark gap; while if the pressure is increased above atmospheric pressure a greater voltage is required.

The best way to make a rough measurement of the voltage at the sparking plug points on a motor cycle is, with the

Testing the voltage at plug points.

ignition connections as usual, to connect an alternative spark gap to earth from the terminal of the sparking plug. This spark gap should consist of two polished brass balls, each ball being about one centimetre in diameter. The knobs should be placed well apart and the engine started up. The knobs can be gradually brought closer together until at a certain position the spark sometimes occurs at the external spark gap and sometimes at the plug points. When this occurs it shows that the resistance of the external spark gap in air and of the plug gap in compression are approximately equal. Usually the distance between the knobs of the external spark gap will be about  $1\frac{1}{2}$  mm., which, on the basis of 33,000 volts to a centimetre, indicates about 5,000 volts.

This voltage corresponds to a spark gap at the plug points of the usual  $\frac{1}{2}$  mm., but if the sparking plug points are set wide apart, then the voltage will be higher, while if the sparking plug points are set closer than  $\frac{1}{2}$  mm., the voltage will be lower than 5,000 volts.

THE LODGE SPARKING PLUG CO., LTD.

### Motor Attachments.

Sir,—"Ixion's" article under "American Advertising" in your issue of March 23rd would lead one to believe that the Auto-Wheel is the only attachment on the market which may with safety be attached to an ordinary push-bicycle, and that the ordinary cycle frame should be strengthened before fitting even the weakest of motor sets. Now as this is likely to prejudice the reputation of the J.E.S. 1 h.p. four-stroke motor attachment, I hope to be allowed to say a few words in defence.

No person is in a position to say definitely that a medium quality push-bicycle frame is or is not strong enough to carry an engine such as, say, the J.E.S. without having proved it by actual tests. Whether "Ixion" has carried out such tests remains for him to say. Personally, I have no hesitation in saying that a medium quality push-cycle with a J.E.S. fitted, and with front fork stays added, is as safe as the ordinary motor cycle. Of course, no one would expect me to say anything against my own production; therefore I would like to point out that my claim is based on the actual experience of private owners since 1909, when the first J.E.S. was put on the road, and of the many hundreds of these attachments which have been sold not one single case of a broken frame has come to my notice, and I know of a few local riders who have travelled many thousands of miles. In one case the rider is 15 stone weight, and had his old push-cycle fitted with a J.E.S. in 1912, and has travelled well over 12,000 miles; his machine is now as good

as ever. Now I ask is it right, in view of such convincing proof, to hint that such a combination is unsafe?

J. E. SMITH.

### A Novel Use for a Motor Cycle.

Sir,—I think I have rather a novel use for my motor cycle during the time when I am at school and am not allowed to use it. The machine is a  $3\frac{1}{2}$  h.p. Ivy-Precision with a three-speed Sturmey-Archer hub gear. The brake rim is fixed to the right side of the wheel, while the brake works on the outside of it. The inside of this is used as a belt rim, with a cord drive to the lathe in our metal shop. Attached to the pulley by means of a chuck is a 2ft. aeroplane propeller.

How our correspondent, A. K. B., arranges for the cooling of his motor cycle engine when it is driving a lathe.

As petrol is so expensive, I have removed the float chamber, and have attached the coal-gas supply to the rest of the carburetter (an Amac). After several experiments it was found that combustion did not take place unless the extra air was stopped up. The carbon deposit was decreased, as was also the exhaust, which was led away by an iron pipe. Starting is extremely easy, for as soon as the gas is turned on and a slight swing given to the belt rim (the belt rim being separate from the wheel) the engine fires immediately. The power is about four-fifths of that given by petrol.

A.K.B.

Motor cycle driving a lathe. (See letter from A. K. B.)

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

#### Local Taxation Licence.

**Q.** I purchased a 2½ h.p. motor cycle second-hand in July last. The £1 tax for 1915 had already been paid by the former owner. Would you kindly let me know if I have to pay the tax for 1915 over again, as the secretary of the County Council demands payment?—J.H.A.

The local taxation licence applies to the owner and not to any particular machine. You are therefore liable for last year's tax.

#### Regulating Mechanical Lubricator.

**Q.** My machine is a 1915 3 h.p. twin, Amac carburetter, mechanical force feed lubrication. (1.) I find that by turning the oil tap at the bottom of the glass reservoir on fully, viz., about five half turns, I over-lubricate. Result—sooted plugs and considerable smoking. How can I regulate to get the correct amount of oil? I may mention that with the tap turned fully on it runs back very fast by the return pipe into the top of the reservoir, and also uses up a considerable quantity of oil. (2.) If the machine is run for a time with the oil tap turned off, will all the oil from the crank case be pumped back into the reservoir by the return pipe, or does the action of pumping back cease when the oil tap is turned off. (3.) I have run now almost fifty miles, and was surprised to find that I had used one gallon of petrol. The machine runs with the air lever fully opened at all speeds and levels as far as I can judge. This led me to believe that possibly the carburetter was not taking in enough air. I have therefore just cleaned the air inlet gauzes, which I found rather dirty. Do you think that this will remedy the excessive fuel consumption? (4.) I found that the quantity of petrol in the tank reduced itself by a good quarter of an inch whilst standing idle recently. Is it likely that the needle valve needs grinding?—W.C.

(1.) You should find that one to one and a half turns of the oil regulator should be ample. Do not have so much oil turned on that the engine smokes continually. If the engine is receiving sufficient oil there should be a faint blue smoke issuing from the exhaust upon opening out after running light for a

time. (2.) No; the oil which is returned to the reservoir is the excess oil which has overflowed from the crank case into the sump. The oil will continue to be pumped back until the oil in the sump drops to a certain level. (3.) The excessive petrol consumption may be due to too large a jet. If the air intake gauze is stopped up this would also cause excessive consumption. With this carburetter, you should not be able to give absolutely full air at all speeds. When travelling all out on the level an improvement should be able to be effected if the air lever is very slightly closed down. If this is not so too large a jet is fitted. (4.) You should make sure there is no small leak anywhere in the tank, and that the petrol pipe is not cracked or leaking anywhere. The carburetter needle valve does not require grinding in unless petrol drips when the machine is standing. Always turn the petrol off when leaving the machine for the night. The fact that the petrol is reduced in the tank while standing suggests a leakage which should be located and stopped. We have personally completed a tour of 520 miles on four gallons of petrol No. 2 on a similar machine, crossing Dartmoor en route.

#### Engine will not Answer Throttle.

**Q.** I have a 6 h.p. twin with Senspray (jet 38), and when running the machine will not take full throttle. As a matter of fact, when opened beyond threequarters the engine slows down. I had previously a 44 jet, but experienced the same trouble, and concluded that the mixture was too rich, but cannot see that that is so as the air opening remains constant, and opening the throttle merely uncovers the full bore of the induction pipe. The engine runs hotter than some others I know, but does not overheat.—R.B.

Your trouble may be due to the carburetter being of too large a size for your engine, and so when the throttle is opened beyond a certain degree the suction is insufficient, so causing the power to decrease. If closing the air lever slightly improves matters, it is almost certain to be this or too small a jet. On the other hand, if closing the air makes matters worse the trouble is probably due to too large a jet causing an over-rich mixture at full throttle.

#### Suitable Gear for Sidecarrier.

**Q.** I intend using a machine with a three-speed hub gear for bread delivery. The driver, who has little or no experience of motors, I am inclined to think, would be likely to damage the gears for want of practical experience. Would you advise me to fit any other make of gear, such as a variable pulley? Under present circumstances, parts are difficult to obtain, and delay would mean considerable loss and inconvenience.—C.J.A.

You should have no trouble in changing these gears, hub gears being one of the easiest types to change. Of course, a variable pulley would be less likely to be damaged, but we do not think you would get anything like the results as with the gear. You should warn your man that when changing gear to a higher gear it is necessary either to declutch and throttle down or lift the exhaust valve while the change is being made.

#### Additional Cooling.

**Q.** In *The Motor Cycle* of October 21st, 1915, there is an article on "Internal Resistance," page 391. Under the heading "Cooling" it is stated that much better cooling results can be obtained by interposing coiled wire between the radiating fins or by the use of extra aluminium fins. I shall be much obliged if you will give me some details on the following: (1.) What exactly is meant by coiled wire? (2.) Of what metal is the wire made? (3.) What is the thickness of the wire? (4.) Is it simply tightened up round the cylinder between the fins, and touching the cylinder wall all round? This subject is very interesting to anyone owning a motor cycle and stationed in a tropical climate.—J.G.V.

(1.) The wire is coiled and inserted between the radiating fins, both round the cylinder and on the head. (2.) The wire should be for preference of copper, but brass or iron may be used with fair results. (3.) Of medium thickness, say about 1 mm. (4.) The coils should wedge themselves between the existing radiating flanges of the cylinder, but might be secured by wire if necessary. Springs can be obtained ready made for this purpose.

#### PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

**Retaining the Old Registration Number.**

I am thinking of disposing of my present motor cycle and buying another second-hand, and am desirous of keeping my old numbers. Could this be done, and if so, how should I proceed? What should I do with the number of the new mount?—G.F.B.

If you like you can retain your old numbers. You will have to get permission to do this from the registration authorities, which should be asked at the time of cancelling the registration of the old machine. It will be necessary to pay full fees. The old numbers on the new mount should be cancelled at the same time.

**Long v. Short Stroke.**

(1.) I am thinking of purchasing a motor cycle with a long stroke engine, but have been repeatedly told that such engines very quickly develop wear in the bearings, etc. Is this so? (2.) Comparing a  $3\frac{1}{2}$  h.p. square engine with one of the long stroke type, from which should I expect longer service without requiring rebushing or re-boring?—W.G.C.

In properly constructed engines it is unlikely that there would be any difference between the wearing capabilities of the two types, though in all probability the short stroke would be more likely to wear out first, owing to the fact that these engines are intended to develop their power chiefly by the speed at which they run, and would consequently have more work to do. Again, in the long stroke the greater angularity of the connecting rod, if such existed, might cause greater piston wear than would occur in a short stroke engine.

**Carburettor Adjustments.**

I have a  $2\frac{1}{2}$  h.p. two-stroke fitted with a Senspray carburettor. If I close the jet to two-stroke on, say,  $30^\circ$  of throttle opening, it will not take more than  $120^\circ$  at the most with air lever fully open. If I bring the air lever back, it loses power. If I broach out the jet to take full air and full throttle, it eight-strokes up to  $30^\circ$ , then four-strokes to about  $90^\circ$ , with consequent loss of power, but beyond that roars up any hill, and does not overheat. Petrol consumption is in the region of 50-60 m.p.g. I should be glad to know how to get the maximum of power and minimum of consumption.—JET.

It is practically impossible to tell you any fixed method of getting the best adjustments with your carburettor, as this can only be done by experiment. It is possible that when using the smaller jet your petrol level is too low. The carburettor you have fitted is one which is inclined to be very sensitive to various throttle openings, yet if correctly adjusted you should have no difficulty with either fast or slow running. You should make sure that the jet screws in so that the jet orifice is exactly in the centre of the little funnel-shaped tube. If this is not central you might get the erratic running you speak of. The petrol level

should rise to within about  $\frac{1}{8}$  in. to  $\frac{1}{4}$  in. from the jet opening on this make of carburettor—that is, rather lower than is usually allowed on other makes. Make sure there are no air leaks either in the induction pipe or crank case.

**A Loose Nut in the Crank Chamber.**

In taking down my  $3\frac{1}{2}$  h.p. single-cylinder for cleaning, I unfortunately dropped one of the locking nuts into the base chamber. Will it be quite safe to run the machine with it in, or will it be necessary to have the whole dismantled?—A.E.D.

Probably if you took the cylinder off and washed out the crank case, then poked round with a stiff wire, or with a magnet attached to a rod, you would be able to fish out the nut, and this would save any further dismantling. It would most certainly not be safe to run the engine with anything loose in the crank chamber, as one never knows what may happen. As there is not much room, it is just possible that the nut may be lying between the two flywheels.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

“J.K.W.R.” (Warwick).— $2\frac{3}{4}$  h.p. two-stroke British Excelsior, solo and with sidecar.

“A.C.” (Bude).—7 h.p. model G Powerplus Indian. Petrol consumption, controllability in traffic, and general reliability.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal to perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## IMPORTANT NOTICE.

Owing to the Easter Holidays, the issue of "The Motor Cycle" for April 27th must be closed for press earlier than usual. All copy and instructions for Miscellaneous Advertisements in that issue must therefore be in our hands not later than first post on Thursday, April 20th.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## Rex.

**REX**, 1912, 8 h.p. J.A.P. engine, coachbuilt sidecar; bargain, £35.—Reeves, Garage, Furley. Phone: 384. [4165]

**REX**, 1912, 6 h.p., with sidecar, almost new tyres; £35, or best offer.—Annett, Terrace Rd., Walton-on-Thames. [4115]

**REX** Motor Cycle, mag., Druids, new tyres, good condition; first £8 secures.—21, Clarence Rd., Hinkley. [X7801]

**£15-3½ h.p. Rex**, Bosch, B. and B., stand and carrier, fast, also 2-speed free engine back wheel; £25.—Foreman, 25a, McLeod Rd., Plumstead. [4050]

**REX**, 1913, 6 h.p., 2-speed, free engine, coach combination, fitted hood and screen, just overhauled, perfect condition, powerful and reliable; £45 cash; take solo or lightweight part.—A. Holland, Earlsdon, Coventry. [X7847]

## Rex-Jap.

**REX-J.A.P.**, 6 h.p., 1915, coachbuilt sidecar, 3-speed countershaft; cost £98, take £55.—307, Goldhawk Rd., W. [4027]

## Rover.

**1914 Rover**, 3½ h.p., T.T., Philipson pulley, very fast and sporty machine; £29/10.—Alexander's, 115, Lothian Rd., Edinburgh. [3621]

**ROVER**, perfect condition, fast; a bargain, £22, or offer.—Cannon's Garage, near Piggs Marsh, London Rd., Mitcham, Surrey. [4150]

**1915 Rover**, 3½ h.p., F.E. N.S.U. gear, lamp, horn, speedometer, good condition; £29/10.—Robinson's Garage, Green St., Cambridge. [4131]

**FOR Sale**, Rover 3½ h.p. coachbuilt combination, perfect, reliable, 2 new Dunlop tyres, or exchange 4-h.p. Zenith.—Goding Bros., Fore St., Ipswich. [4011]

**ROVER**, 1916 T.T. models in stock, fitted with handle-bar controlled Philipson pulley; £56; exchanges or extended terms quoted.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0598]

**ROVER**, late 1915, T.T., Philipson pulley, Dunlops (650x65), Lucas lamp, horn, rear lamp, condition as new, very fast machine, guaranteed perfect; approval against cash.—Walter Matthews, 117, Suffolk St., Birmingham. [X7851]

## Royal Ruby.

**ROYAL Ruby** 2-stroke, June, 1915; £20, lowest.—Red Garage, Malton. [X7799]

**1915 Royal Ruby**, 2½ h.p., 2-speed, speedometer, P. and H. lamps, Handophone, Palmer codr tyres; £27, or offers.—Oliver, D74, Machine Gun Centre, Harrowby Camp, Grantham. [X7765]

## Rudge.

**1912 3½ h.p. Rudge**, free engine, good condition; £25.—R. E. Jones (Garages), Ltd., Swansea. [0785]

# Forward

—the fasteners  
that never fail—

cover all requirements, and a range of prices to suit all purses.

Note the patterns which we illustrate below—note the prices—and then ask your dealer, or us, for fuller details.

Patent No.  
19488/09

## The FORWARD—

the fastener with hardened steel rollers that really roll.

Adjustable 1/6

## The KING HOOK—

The King of all Hook Types.

Detachable 1/-; Adjustable 1/3

## MOTOR CYCLES FOR SALE.

### Rudge.

1915 Rudge Multi and coachbuilt sidecar, 3 1/2 h.p., as new; price £48.—Percy Platt, Mumps, Oldham. [4103]

RUDGE Multi, 1913, free engine, sidecar, perfect condition; £36.—56, Earl Marshall Rd., Pitsmoor, Sheffield. [X7650]

RUDGE Multi, 3 1/2 h.p., 1913, recently overhauled, in excellent running condition; £51, or near offer.—Gelder, Longmarton, Carlisle. [X7738]

RUDGE Multi, T.T., 3 1/2 h.p., complete, speedometer, lamps, horn, all in perfect condition; £45, or near offer.—Shapley, 1, Park Mount, Torquay. [4042]

1912 1/2 Rudge, free engine, good tyres, belt, all accessories, splendid order, very little used; £28.—Apply, E. Chrimes, Neston, Cheshire. [4097]

RUDGE Multi 1916 3 1/2 h.p. Roadsters, £58/15; three in stock, and Canoelet sidecars to suit; exchanges.—D. J. Shepherd and Co., Enfield Highway. [4072]

LATE 1915 Isle of Man T.T. Rudge Multi, under 1,300 miles, perfect condition throughout, usual accessories, spares, unscratched, unpunctured; £48.—Box 329, c/o The Motor Cycle. [X7873]

RUDGE Multi, late 1914, 5-6b.p., Paragon sidecar, all accessories, 3 lamps, trip speed meter, tyres new, guarantee perfect running; trial run given; price £55.—2, Salisbury Rd., Seven Kings, Essex. [4061]

### Scott.

SCOTT, 3 1/2 h.p., 1912, and sidecar, 2-speed, kick starter, Binks; £52/10.—Webb, Hillside, Burnham, Bucks. [4180]

SCOTT, T.T., 2-speed, kick start, fast machine; owner enlisted; £19.—must sell.—Bell, 36, Southwark Park Rd., S.E. [4033]

1915 Scott, in Ireland, new last July, only ridden 100 miles, carefully stored since; what offers?—A. Sikes, Lieut. A.O.D., Red Barracks, Woolwich, S.E. [X7747]

SCOTT, 3 1/2 h.p., 2-speed, and Millford cane sidecar, splendid running order, tyres almost new; must sell, £24, first cheque secures.—Main, 47, Wellgate, Dundee. [X7803]

SCOTT Combination, 1912-13, scarcely used since August, 1914, sweet machine, in perfect condition throughout, tool kit and spares, lamp, speedometer, etc.; nearest to £40 secures, bargain.—Tilley's Garage, Dorchester. [X7655]

### Singer.

SINGER, 1913, 3 1/2 h.p., 3-speed, clutch; bargain, £19.—95, Morant Rd., Colchester. [4174]

7-9h.p. Singer Chassis, guaranteed mechanically perfect, sound tyres, no engine; £25.—Irving, 47, Mesnes St., Wigan. [X7742]

SINGER, 4h.p., 2-speed countershaft, coachbuilt combination, speedometer, head lamp, horn, mileage only 2,600; £45.—Steele, Glenfeshie, Camberley. [X7735]

### Sun.

SUN, 2-strokes; all models from stock from £29/10.—Culmore Depot, 261, Deansgate, Manchester. [3654]

SUN-VILLIERS, unused, £23/10; 2-speed, £28/10; one second-hand, £19.—Oracle Motors, 336, Gray's Inn Rd., W.C. [4030]

SUN-V.T.S., 1916, 2 1/2 h.p., 2-stroke, 2-speed, practically new; bargain, £28.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0491]

SUN-VILLIERS, 1916, 2 1/2 h.p., run 100 miles, like new, lamp; £23; will exchange Douglas, cash adjustment.—King, Chemist, Sutton, Surrey. [4147]

1915 Sun-Villiers, splendid condition; 20 gns. very great bargain.—Julians, Broad St., Reading. Biggest motor cycle and light car dealers in the South. Phone: 1024. [X5386]

### Sunbeam.

1916 Sunbeam, 3 1/2 h.p., £5/5 speedometer, large Lucas lamp and generator, tail lamp, mechanical horn, done 600 miles, as new; £68.—Dickinson, High Town, Luton. [X7819]

LATE 1914 3 1/2 h.p. Sunbeam, with Canoelet sidecar, complete with speedometer, Lucas lamps, and horn; £65.—E. C. Wheeler, Nestle, King's Rd., Newbury, Berks. [X7459]

### T.D.C.

1914 T.D.C. De Luxe special model, 2 1/2 h.p., 2-stroke, not run 100 miles, variable gear, guaranteed perfect, take two anywhere, all on; £24; ride away; free lessons if novice.—4, Gaywood Rd., Walthamstow. [4176]

### Thorn.

8h.p. Thorn Motor Cycle, 1915, 2-speed, electric light, electric horn, speedometer, coachbuilt sidecar, has only done 500 miles; £75.—Portman Garage, 174, Upper Richmond Rd., East Sheen, London, S.W. [4066]

### T.M.C.

T.M.C. 4-cyl. late 1913 Combination, hood and glass screen, 3-speed gear box, water-cooled, force feed lubrication, just overhauled, fitted with 3 electric lamps and battery; £50.—Engineer, Electricity Works, Newbury. [X7470]

### Triumph.

TRIUMPH, 2-speed, free engine, good order; £25.—Bright, Bridge St., Exeter. [4025]

# ? What is WRONG with the Machine.

How often motor cyclists ask this question when mysterious troubles arise—and how difficult it is at times to trace the fault!

## TIME and TEMPER

can be saved by purchasing a copy of

# “TRACING TROUBLES”

which gives a reliable method for locating every possible fault to which a motor cycle is liable, together with a remedy for every fault.

## Clutches on Two-strokes.

**W**EIRD as are the outlines of America's first coquettings with the lightweight two-stroke movement, in one respect she seems to follow a wise lead. Too many British designers have adopted the axiom that as a two-stroke engine is childish easy to start, and as the price of the lightweights must be kept down, there is no need to incorporate a starting device or a free engine clutch. Our experience with tiny two-strokes has almost invariably been that they are poor starters, using the term in a peculiar sense. It is the easiest thing in the world to get the initial explosions; you can get them while wheeling the machine out of its shed if everything is in tune. But whereas the initial explosions of a cold four-stroke engine are normal explosions, with vim and power behind them, the initial explosions of a two-stroke are almost always of the four-stroke type, and though the engine will fire at the first push, it fires feebly, and takes some while to pick up and to settle down into the proper two-stroke burr. When we invested in our first two-stroke lightweight we used to paddle out of the shed, four-stroking merrily, and as soon as a slight up-grade was encountered in the road outside the gate the engine got wearier and wearier, and usually stopped dead a few yards up the road. After a few humiliations of this kind, we adopted the practice of warming it up on the stand before leaving the garage. Now and then we have sampled lightweights which will two-stroke instantaneously from cold, but most two-strokes expect a little humouring, and therefore many of them would be the better for a starting device, whether or not a free engine clutch be fitted. As a matter of fact, the handle-bar clutch would serve this need well; one would then start the engine four-stroking by paddling the machine, disengage the clutch after a few explosions, and go ahead when the engine had settled down to its normal running.

## The Taxation Proposals and Recruiting.

**A** POINT which was brought up in a letter appearing in our last issue in opposition to the new taxes deserves more than passing attention. It is the possibility that young men who are at present just able to afford motor bicycles may be bound to give up their machines by reason of the increased cost of owning and running them. At first sight there may appear no particular hardship in this, but it must be remembered that the ranks of practically all the specialised Services of the British Army have been filled by men whose interest in things mechanical has been aroused entirely by their experience with motor cycles and motor cars. These men have been able to start using their motor vehicles whilst quite young, and have thus gradually become amateur mechanics and automatically ideal candidates for the different mechanical sections included in our efficient Army. It is no exaggeration to say that the quick manner in which recruits have been able to grasp the intricacies of a machine gun, of big artillery, ordnance repairs, flying machine repairs, and in fact the numerous details of any complicated machine of war, is due in a large measure to their practical interest in mechanics excited by experience with a motor vehicle. Now, when it is remembered that these, in the majority of cases, have to serve their motor cycle novitiate on a third or fourth hand machine, which is second to none in the matter of giving first-hand practice, but is valued at only about ten pounds, it will be seen how unfair the new taxes are, and how they may redound in a way disadvantageous to the interests of the country. The correspondent already referred to plaintively asked what sport and industry have furnished flying men, A.S.C. and M.M.G. units, with material such as has been recruited from the ranks of motor cyclists. How many men, too, knew they had any mechanical proclivities until they handled a motor cycle?

### A Correction.

I let myself be betrayed into a bad slip the other week when I described a two-stroke as developing double the power of a four-stroke of similar c.c. Obviously, the shorter induction period of a two-stroke handicaps it per firing stroke, and the power proportion in favour of the two-stroke is therefore only about 4:3 instead of 2:1, as I falsely stated in a recent paragraph.

### Spark Advance for Dixie Magnetos.

One or two readers who have consulted me on the above topic may be grateful to Sapper W. F. Messenger for the following instructions: "Turn off the bosses which hold the ball for snapping on the magneto cover; fit the two contacts and the condenser on to a brass 'fiddle,' the fiddle being turned to fit the spigot made when the two bosses above mentioned are removed. Fasten the whole in place by a flat spring tongue, after the fashion of the securing spring on a Bosch magneto." This conversion was carried out for Sapper Messenger by Messrs. Parker and Rice, of Park Road North, Acton, W. It is described as having two weaknesses—it required a very stiff spring to prevent the cam from lifting the fiddle in lieu of opening the platina; and both water and dust had fairly easy access to the points. But Sapper Messenger describes it as a good job, and says the makers have doubtless perfected it by now, as his was one of the earliest conversions which they undertook.

### Decarbonising Four-cylinders.

I lent a grimy hand at the job of decarbonising one of the latest water-cooled American four-cylinder cars last week, and noticed with deep interest that the owner (an amateur) completed the job in a few minutes under two hours, a lesser time than the owners of many twin-cylinder motor bicycles normally devote to the same work. But the engine was of peculiar design, resembling the Ford, in that its engine was sliced horizontally across at the level of the valve seats, the entire top of the water jacket lifting off after a dozen nuts were unscrewed. If it is possible to get a simple gas and water-tight joint on such an engine, a similar construction should be quite adaptable to air-cooled four-cylinder motor cycle engines, where the problem is not complicated by any water joint. In this case one of the main points urged against the four-cylinder bicycles in our recent discussion (viz., the labour of decarbonisation) might be ruled out at one swoop. On the engine under notice a simple copper-asbestos washer appeared thoroughly efficient in sealing the combined gas and water joint, provided a certain obvious routine were observed in tightening down the securing nuts; the owner, needless to say, commenced by tightening down the central nuts first, then those at the two ends; and he gave each nut a turn or two in series. Incidentally, this mode of construction gives the maker a chance to

machine the inside of the cylinder head, and gives the user a chance to scrape it thoroughly; whereas with the average motor bicycle engine, the inside of the head is left rough, and the rider can never scrape and polish it up afterwards as he would wish to do. But the detachable cylinder-head went out with the old De Dion 2¾ h.p. engine, and few people have shown much enthusiasm for it since those days. Cannot we be trusted with it again? It has obvious merits even on single cylinders, and the main difficulty, of anchoring its supporting bolts firmly in an aluminium crank case, is surely not insuperable.

### Wanted, a Quick-access Carrier Case.

I rather wonder that no accessory maker has brought out a carrier luggage case which can be opened in a few seconds without unfastening any straps. So many riders use their machines for various business purposes that a quick-access luggage case would be very handy. I believe a sort of sliding Noah's ark case used to be sold by Dunhills, and one or two makers sell lockable bags attached to the carrier by claw-clips on their undersides, but the latter are apt to lose their shape when the lock tongues cease to register. There would be fair sales for a case made on the lines of a glorified matchbox, with the outer casing stiffened by metal, the front end sealed, and the sliding drawer fastened by a spring catch with an optional lock.

### Unscrupulous Trading.

I do not suppose that every dealer would reckon the following as a case of unscrupulous trading, but I state the case in the conviction that it is nothing less. A young canvasser, travelling one of the hilliest counties in Great Britain with rather heavy samples, consulted a local agent about a sidecar outfit, naming his price limit, which was distinctly too low. The dealer unloaded on to his innocent client a 1912 3½ h.p. machine and sidecar, in fair condition, fitted with an obsolete type of crankshaft two-speed gear, affording an emergency ratio of about 7 to 1 in conjunction with a very small pulley diameter. The price charged was fair. Needless to say, the embryo motor cyclist has experienced some very trying times on hills. He has denounced motor cycling in unmeasured terms to many possible purchasers, who watched his unhappy experiment with keen interest; and though he is now acquiring sufficient knowledge to see that his own victimisation does not rule all motor cycles out of court, he has done untold harm in his own district. The dealer ought to have said frankly, "Nobody can sell you a machine which will do your work at your price; come back when you have saved another £20." He has actually injured his own future trade to an incredible degree in order to clear out a machine which would easily have fetched its value in a district where it would rank as roadworthy.

## NAVAL AND MILITARY NOTES.

MOTOR CYCLISTS IN THE SERVICES SEND NEWS FROM FAR AND NEAR.

## FROM A REPAIR BASE.

S. A. M. WHITHAM is a name that will be familiar to many readers, as, apart from his short connection with the editorial staff of *The Motor Cycle*, he is well known as a successful track rider. For nearly nine months now he has been at a repair base in France working on despatch riders' machines. In a recent letter he writes very cheerfully, and tells us, as have others in similar positions, that he has learnt quite a lot on his new job.

you know, one rides on the right, the sidecar being on the left; consequently any attempt to pull out into the middle of the road, at even a moderate speed, results in the sidecar wheel acting as its brother on an aeroplane, and leaving *terra firma* for a less stable element. After the preliminary shock this becomes a fascinating pastime, though not one to be indulged in when meeting fast staff cars.

## At Gallipoli.

"On Lemnos Island I rode a Scott (solo) and a Douglas. The Scott was remarkable for the fact that it refused to skid to any great extent in the loose sand, even when taking a sharp turn that ordinarily would send one to earth very promptly.

"I landed a Douglas on the beach at Suvla on August 8th, and had to push it from the water's edge through very loose sand for a few hundred yards. It was extremely hot, and shells (mostly of the 'dud' or non-exploding variety) fell around in moderate quantities. After the first week at Suvla I spent the greater part of my time behind a machine gun, with an occasional short run on a dilapidated 'Dug.'

"A little trip across the water to Imbros, in November, gave me an opportunity to try a Clyno outfit, which was being used as a sort of speed delivery van for aeroplane spares, mails, and, in fact, any old 'clobber.' It was a great joy to ride something with two fairly hefty cylinders, on some sort of a road.

## Few Machines at Malta.

"A large proportion of the motor cycles at Suvla were the new counter-

Miss Dora Rowlandson, sister of Lt. S. A. Rowlandson, A.S.C. (M.T.) mounted upon the latter's 5-6 h.p. single-cylinder Rudge. The machine is still going well after many miles of competition work before the war. Since Rowlandson went on active service it has been used by his mother and sister.

shaft Triumphs. They seemed capable of anything, and certainly the riders could take them anywhere. I must not mention the brigade or division, but I would back those particular riders against any picked team in a competition for accomplishing the impossible.

"There are disgracefully few motor cycles in Malta, but after weeks of waiting I have at last discovered one 'bus' worth mentioning. A, twin Zenith, very red, exhaust pipes like drain pipes, and bars nearly to the ground.

"Also I have seen one happy reminder of the Portsmouth Road on a Sunday—a mysterious speed merchant, complete with one flapper on carrier, a practice which I know you don't uphold. Neither do I, in theory—but give me half a chance. . . ."

## RAPID PROMOTION.

A. J. PALMER, formerly assistant cashier to *The Motor Cycle*, has been promoted to temporary Captain in the Motor Machine Gun Service. Captain Palmer's promotion has been rapid. He enlisted in the No. 5 (Coventry) Battery in the autumn of 1914, was soon a sergeant, then sergeant-major, subsequently being granted a commission, which led to his captaincy.

## PRESENT DAY COMMANDEERING.

LAST week a Midland rider had his Douglas motor cycle requisitioned by the military authorities who were stationed in his district repairing telephone wires. This is the first time we have heard of motor cycles being commandeered since the early days of the war.

## CAPTAINCY FOR WELL-KNOWN MOTOR CYCLIST.

JACK WOODHOUSE, the well-known Midland rider of Quadrant and Precision machines, is now Capt. Jack Woodhouse, Flight Commander, R.F.C. He has seen considerable service in France, and has been awarded the Military Cross. He has been at home on leave for a few days.

## EXPERIENCES IN FRANCE, GALLI-POLI, AND MALTA.

WE are indebted to P.O. G. L. Rossiter, of the R.N. Armoured Car Division, for the letter we reproduce in *extenso* below. Some readers may think that news of doings at Gallipoli are now rather out of date, but in this case the matter is too interesting to be omitted on that score:

"I was in France for a time with a Scott-Vickers sidecar machine gun outfit, and although occasionally under shell fire, in Dunkirk, I did not see any action with the machine. However, I learnt to ride with the sidecar wheel off the ground, as most roads have a considerable amount of camber, and, as

Three R.F.C. mechanics in a French town. The man riding the solo P. and M. is Sgt. H. Cook, now in charge of a P. and M. army repair depot in France, and formerly in the employ of Messrs. Phelon and Moore. The Royal Flying Corps, it will be remembered, use motor cycles of this make exclusively.

# THE AERO ENGINE.

## HOW WAR-TIME DEVELOPMENTS MAY HELP MOTOR CYCLE DESIGN.

Previous instalments appeared in "The Motor Cycle" of December 16th, February 24th, and March 9th.

**I**N arranging this series of articles upon the aero engine, the various types have been dealt with in a sequence chosen so as to commence with varieties that are furthest removed from the common standard motor car type and thence to progress towards the latter. Where a close similarity exists between the aero engine and that of the motor cycle special notice is drawn.

The next in order will be the air-cooled V engine, and afterwards the water-cooled V and the line ahead water-cooled six-cylinder. Previous to the war, in this country the engine chiefly in favour with the authorities was the eight-cylinder V type Renault, which possessed over the Gnome and other types certain features of superiority in the matter of fuel and oil consumption, and the ability to run over longer periods before dismantling for cleaning and wear became necessary. It is, perhaps, true to say that the 70 h.p. Renault found greater exclusive favour over here than it did in the country of its origin—France. This engine has eight air-cooled cylinders of 96 mm. bore and 140 mm. stroke, set at right angles in two groups of four, developing 70 h.p. at 1,800 r.p.m.

### The Cult of the V Engine.

The advantages of the eight-cylinder 90° V design are, broadly, a very fair balance, an even torque, accessibility, and compactness in front view. Although the type scores considerably over the six-cylinder line ahead type in the matter of shortness of crank case and of crankshaft, yet it seems unquestionable that it is, not only on that ground but as regards balance as well, inferior to the radial engine. However, as the V engine sits very compactly into the nose of an aeroplane fuselage it has met with some considerable favour. That the V engine has been popular proves but little; any type of engine which proves its reliability, power, and suitability for any particular purpose will be devoted by the world in general to that purpose forthwith, and moreover is likely to be copied and duplicated for that purpose, without the market standing still to await the perfection of any design theoretically more desirable.

To return to the Renault engine, although its original lines were suggested by deduction rather than by following motor cycle practice, yet it has much in common with the motor cycle engine. The cylinder barrels are of cast iron with a multitude of fine cooling fins, the head, also of cast iron, is detachable, and

four long bolts passing through a spider above the head clamp the latter to the cylinder and the cylinder to the crank case. The mechanically-operated inlet valve is at the cylinder side with the exhaust valve above, an arrangement which is good from several points of view, since the cooling effect of the inlet gases is available close to the cylinder walls, also the inlet gases in their travel pass over the face of the exhaust valve, and serve to soothe its temperature.

### On Valve Disposition.

Although from a theoretical point of view the hemispherical combustion chamber with overhead valves is more desirable, yet it is possible that from a mechanical point of view, so far as the air-cooled cylinder is concerned, the L-head arrangement of the

Renault may be better practice. In any case, there can be little doubt that this type of L head is better than the side-by-side valve arrangement generally adopted in motor cycle design. It may be taken as a hard and fast rule that the seating of any exhaust valve in any type of engine must be directly cooled, that is to say, the exterior of the seating must either be provided with ribs to conduct the heat away so that the air may (unwillingly) absorb it, or it must be in direct contact with the contents of the jacket if water cooling is used. In any but very low efficiency engines exhaust valves in detachable cages are a mistake. It is well-nigh impossible to obtain a sufficiently good heat contact between the cage and the cylinder head walls, and trouble

with the seat or the valve is assured. With the inlet valve, on the other hand, owing to the virtue of the cool inlet gases a detachable seat is quite sound and permissible.

Now if an air-cooled cylinder be designed with both valves overhead, one thing becomes at once obvious. Unless the exhaust valve seat is detachable it will be impossible to remove an exhaust valve without taking off the whole cylinder. This is a point wholly repugnant to the motor cycle user, but apparently not so to the aero engine user, as will be referred to later. Added to that the motor cyclist has a most unholy fear of a broken overhead valve falling on his piston crown and wrecking the engine. Maybe this shyness on his part is the fruit of bitter experience; however, the fact remains that breakages are not at all common on modern overhead valve engines in which the valves are of correct design and of suitable material.

(Upper) Crank case in plan showing how the pairs of cylinders in an eight V can be placed opposite if a knuckle-ended master-connecting rod is used.

(Lower) The meaning of staggered cylinders.

**The Aero Engine.—**

It is comparatively a simple matter to allow access to the exhaust valve in an L-headed engine with the inlet above the exhaust. The former valve is given a detachable seating which on removal will permit the removal of the exhaust through the orifice thus displayed. The arrangement is made clear in one of the accompanying diagrams. The advantages of such L-head cylinder design were made so clear in the article by Mr. Granville E. Bradshaw which appeared in *The Motor Cycle* on March 30th last that further discussion by the present writer would be superfluous.

Whilst dealing with the subject of valve positioning, reference may be made to the very simple plan used in the original Austro-Daimler aero engine to make possible in an overhead valve design the removal of the exhaust valve without detaching the complete cylinder, and at the same time to allow the seat of the exhaust valve to remain part and parcel of the cylinder head, in direct contact with the cooling water.

The principle of the design is shown in the attached sketch. Both valves are overhead, but the inlet is carried in a detachable seating. This, when removed, offers an orifice of sufficient size to allow the exhaust valve to pass through after the latter has been undone and allowed to drop completely into the cylinder. This arrangement does not permit a new exhaust valve to be ground in. Of course, it must be remembered that the valves on so large an engine are of considerable size, so that there is some hope of manipulating the exhaust in and out of the inlet orifice with the fingers, but it is questionable whether the small valves and orifices of a motor cycle engine would be other than very tiresome to handle under like circumstances.

**The Renault Crankshaft and Connecting Rods.**

To return, however, to the Renault engine. About the crankshaft bearings there is a peculiarity that has some theoretical advantage concerning the precise nature of which the writer must admit ignorance. The outer bearings are ball races, whilst the centre three are plain. This design has in practice a disadvantage. If the centre plain bearings wear, it is not possible to take up the slack in the usual way, because the crankshaft as a whole is definitely positioned and centred by the ball races. Wear in the upper half of the plain bearing liners necessitates, therefore, that the bearing liners be entirely renewed and lined up afresh, a matter which one would think is more than troublesome on active service, the conditions of which are, after all, the limiting factors of aero engine design.

Another feature which is to be found on the Renault engine almost alone is the use of a hinged connecting

rod; that is to say, the connecting rod of one cylinder on one side of the V utilises the same crank pin as the connecting rod of the cylinder in the same plane on the opposite side of the V. In the Renault arrangement one connecting rod is the master, and carries in its end the big end bearing. The second connecting rod has no direct bearing on the crank pin, but is hinged to the master rod as close to the bearing of the latter as possible. The object of this design is to bring the reciprocating masses of the connecting rods and pistons in the opposite cylinders into the same plane, and thereby avoid unnecessary vibration, besides more particularly avoiding the necessity of offsetting or overhanging the bearings of the connecting rod, and at the same time keeping the length of the engine as small as possible. If each connecting rod of each pair has a big end bearing of reasonable size, then the crank pin must be made longer to accommodate the two, and unless overhung bearings are used the cylinders can no longer be placed opposite one another, but must be staggered, so that the overall length of the engine is increased.

(Left) Arrangement of L head engine with overhead exhaust valve, which can be removed through inlet valve hole.

(Right) Austro-Daimler overhead valve design in which exhaust seats direct on cylinder wall. The inlet valve is in a detachable cage of sufficient size to allow exhaust to be removed through inlet orifice after being passed right into the cylinder.

The hinged connecting rod design does not, however, appear to have met with general favour, possibly because of the effect it has on the comparative movement of the two pistons. The writer does not think that it is likely to survive now that the roller bearing big end is coming into its own, since the roller bearing, particularly of the type used on the A.B.C. motor cycle engine, is quite narrow, and if staggering the cylinders is still necessary

the amount added to the length of the whole engine is too small to be worth worrying about. These considerations take no count of the superiority of the roller bearing in other respects, including self-lubrication.

The Renault is one of the few air-cooled aero engines that is provided with a centrifugal fan, carried at the rear end of the crank case, and a suitable casing around the cylinders to direct the cooling air evenly to the desired places. In England the general practice used to be to remove the fan and casing on engine-in-front or "tractor" machines, and to let the stream from the propeller, aided by suitable scoops, do the work. On "pusher" machines the fan is retained. For an air-cooled engine that is expected to give its maximum power continuously and steadily the speed of revolution of the Renault is high, compared with the Gnome, for instance. The Renault runs at 1,800 r.p.m. This speed is too high for propeller efficiency, a large propeller running at a low speed being desirable, so a 2 to 1 reduction gear is provided for the main drive. As a matter of fact, this reduction gear is utilised to rotate the camshaft in lieu of the ordinary distribution gear.

M.T.

(To be continued.)

## TOP FEED CARBURETTERS.

The Pros and Cons by Manufacturers.

By "IXION."

ONE or two manufacturers have made tardy reply to the challenge implied in recent correspondence on the subject of carburetters designed to take their petrol in at the top of the float chamber, and I confess that in my eyes the designers have made out a strong case for the innovation.

The point which they unanimously place first is that wear of the float needle is greatly retarded by the new arrangement. Any rider who has run one and the same machine for several years will be aware that the ordinary float needle develops a "shoulder" on its point after a comparatively brief mileage, and that once a "shoulder" has developed it is hardly worth while trying to grind the point true. No means are available for holding the point true in the seating; the needle is too light to be slotted for an oscillating tool, and the metal is so soft that the least error from the vertical destroys the point beyond hope of repair. Flooding and waste of fuel result as soon as a needle ceases to be petrol tight. The manufacturers have proved beyond cavil in their exhaustive tests and repair experience that the hammering of the float weights vastly exaggerates wear of the needle in bottom feed carburetters, and that the needle of a top feed carburetter, being relieved of this hammering, lasts reasonably well under the comparatively silky motion imparted to it by the gentle ebb and flow of the petrol.

### Advantages of Top Feed.

Secondly, the float chamber cap can no longer become unscrewed by vibration—a not uncommon mishap which the duffer type of rider (for whom makers ought certainly to cater) is slow to diagnose.

Thirdly, the tinkerer cannot reassemble a top feed float chamber incorrectly, as tinkers often do with the bobweight type.

Fourthly, there are no bobweights to give trouble. Readers may say such trouble

is rare, but, though I run few machines to destruction, I am hung up with bobweight trouble at least once a year on an average; and, *a fortiori*, the commoner type of rider, who wears his machine half out, suffers from it more than I do.

Fifthly, the top feed carburetter can be flooded for starting purposes without waste of petrol; if a finger be placed over the venthole whilst flooding the entire excess of petrol escapes *via* the jet, and is utilised by the engine.

### Petrol Filters.

On the alleged frequency of choked filters, something, of course, depends on the filter. Good filters have plenty of gauze area. For example, the B. and B. type consists of a pencil-shaped tube of gauze, held by a spring in a chamber of greater diameter than the gauze tube. This will not choke within any reasonable period under any circumstances, though the makers find that the best filters get silted up in six months or so with a fluffy substance of which they cannot trace the origin; I should ascribe it to straining substances used at the American refineries. The average bottom feed carburetter has no filter at all, in which case the dirt collects round the needle valve seating and produces intermittent flooding. Those filters consisting of a microscopic cup of gauze are worse than useless, and should be scrapped at sight. Given a decent filter, the top feed may be absolved on the score of a choked petrol pipe.

In my judgment; the factor of increased needle valve durability settled the controversy. But I should couple with this verdict in favour of the top feed a rider to the effect that some makers should redesign the attachments of their petrol pipes and float chamber lids; if both are screwed joints, it becomes a simple matter for a duffer to wreck his petrol pipe in the effort to uncover his float chamber or cleanse the pipe.

Sectional view of a top feed carburetter.

Carburetter chamber with inverted needle valve and no toggles.

Float chamber with toggles and needle pointed at the lower end.

**Lance-Cpl. H. G. Smith, Amm. Sub.Park, B.E.F., writes :****"17/1/16.**

"I am enclosing a photograph which may prove of interest to you. The three machines arrived in France on Sept. 25th, 1914, and since that date have been continually running on Despatch work, over the rough roads of Northern France, without ever having been to a repair depot.

"All three are still running in excellent condition, and I have never once been held up on the road except for belts and tyres.

"I have become so impressed with the strength, power, and absolute reliability of the Triumph, that I have felt compelled to write you these few lines in appreciation."

**TRIUMPH CYCLE CO., LTD., COVENTRY.****TRIUMPH**

## A NEW M.C. COAT.

It is essential that you should protect yourself against the vagaries of Spring weather.

Dunhills' New M.C. Coat will prove an excellent weatherproof for your tour.

It is made of proofed twill with a lining of oil cambric, and is thus impervious to any weather.

A detachable fleece lining is very fashionable with many motor cyclists. It is most useful during the climatic changes at this period of the year.

PRICE £3-15-0

Send a card for pattern.

## ROAD TEST OF BINKS FUEL.

### Comparative Trials Between Binks Fuel and Petrol.

FOR some time past motorists have, very naturally, taken a lively interest in the various schemes which promise a saving in the fuel bill, and the present scarcity of petrol has just about brought matters to a head so far as most motor cyclists are concerned. The Binks system, based on the use of a heavy fuel costing 1s. 3d. per gallon, known as the Binks XXX fuel, is one that has brought a ceaseless flow of enquiries to these offices, and it was with unusual interest that we accepted the courteous offer of Mr. C. Binks to subject his system to a practical road test, a machine belonging to a member of our staff being duly equipped for that purpose.

The claims of the inventor as regards this fuel are already well known, being briefly that, from a practical standpoint, it possesses most of the virtues of petrol and none of the harmful and obnoxious features of paraffin. A Binks carburettor is not essential to its use, though naturally very much better results are obtained by following the Binks system all through. Any good carburettor, fitted with a hot air intake, would probably yield satisfactory results. The chief disadvantage of the fuel is that an engine cannot be started on it from cold, and therefore a subsidiary tank and a two-way tap for a supply of petrol for starting are necessary.

#### Description of Binks Fuel.

The Binks XXX and the BXA fuels are approximately identical. Both are entirely colourless fluids, possessing neither the oily blue tints nor the permeating odours of paraffin. Their specific gravity is .772, and their flashpoint (*i.e.*, the temperature at which an inflammable vapour is given off) is 78° F., while 95% of the fluid distils over at 398° F.

These fuels are not odourless, and being less volatile than petrol their odour is more clinging, but in this respect they are much less offensive than lamp oil.

Unless a portion of one's clothing actually becomes saturated with the fluid, the smell thereof does not permanently attach itself to the person of the rider, as in the case of petroleum, the odour from the exhaust being almost unnoticeable.

#### Machine Used for the Trial.

The machine on which our tests have been carried out is a 1914 3½ h.p. P. and M., with sidecar attached. The weight of the rider and passenger totalled approximately twenty stone, and it may be mentioned that this type of machine is the least

adapted for the use of a heavy fuel. The steady impulse of a twin is almost essential, and, moreover, we may add that the engine of this particular P. and M. is always susceptible to a harmless piston knock, which a heavy fuel considerably accentuates.

A neat round tank, holding about 1½ pints, was fitted to the top bar, and the machine was equipped with a Binks three-jet horizontal carburettor in place of the P. and M. single-jet carburettor previously used. No further alterations were made.

The special hot air intake seen fitted to the three-jet Binks carburettor to facilitate evaporation when running on the special fuel.

#### First Impressions on the Road.

On leaving the Binks works at Eccles it was necessary for us to ride across Manchester, and in negotiating the dense traffic the machine proved very considerably more controllable and much more pleasant to handle than it had proved with the old carburettor and with petrol as the fuel. The manner in which it would tick over, responding instantly to a movement of the throttle lever, was most gratifying, and it was difficult to believe we were using a fuel little lighter than ordinary lamp oil. It was not, indeed, till we had gained the open country, with roads and weather of the worst imaginable, that the presence of the heavy fuel was felt, for it was then found necessary to handle the "spark" control with care on opening the throttle, otherwise a knock ensued.

**Road Test of Binks Fuel.—**

The journey home included several long and trying mountain ascents, and owing to gale and gradient it was on one occasion necessary to proceed for five miles on low gear, the engine pulling better at the end of the climb than previously, owing, doubtless, to the thorough warming up of the hot air intake and induction pipe. Ample power was obtained, and there were no signs of overheating throughout the journey, but owing to the eternal knock at excessive throttle openings it was almost impossible to permit the engine to "rev." with ignition fully advanced.

**An Important Test.**

One of the most gratifying, and probably the most important, of the tests we have been able to complete was with regard to the quantity of carbon deposited in the cylinders when the heavy fuel is used. If a heavy fuel can be entirely vaporised there is nothing whatever against its use, but unless an elaborate vaporiser be incorporated, the difficulty generally lies in so breaking up the atoms of fuel that it reaches the cylinder in the form of a perfect vapour. Unless this be done, liquid particles of the fuel are drawn into the cylinder, with the result that an incomplete explosion and excessive carbonisation ensue. Even more serious is the fact that these liquid particles get past the cylinder rings, and thin down the engine oil. Bad carburation, therefore, with its numerous undesirable results, is immediately shown by excessive carbonisation and by traces of the fuel in the cylinder oil.

Our experiments with regard to this point are certainly the most reassuring, and probably the most important, we have been able to make. It is difficult to believe that, by the Binks system, the heavy fuel is more completely used up than petrol, yet all our trials point to this. We can only state the results of these carefully made tests, giving no guarantee that every rider will be able to obtain the same results.

**No Carbon Deposit.**

Before starting for Manchester, both valve caps were taken out and their inner faces cleaned and polished. Also a new sparking plug was fitted, and the journey of approximately seventy miles completed on petrol. Both caps were then removed, and the

Showing how the small tank of petrol for starting purposes and the interconnection of the petrol and special fuel feeds are fitted on the  $3\frac{1}{2}$  h.p. P. and M.

Simple method of connecting up the petrol and heavy fuel feeds.

exhaust cap was found to be covered with a thin film of carbon, which could be scaled off from the smooth surface of the brass much as old enamel can be scaled from a rusty frame. The plug, also, was discoloured, and after these had been minutely cleaned and replaced, the oil was drained from the crank case and a sample kept.

The return journey was made on the Binks fuel, and the process repeated on reaching home. It was found that there was no deposit whatever on the valve caps and sparking plug, excepting an almost imperceptible coating of soot, evidently caused by a rich mixture in starting, and which could be removed by rubbing with a duster. The porcelain of the sparking plug was quite clean, and no trace of the fuel could be found in the lubricating oil.

A heavy grade cylinder oil had been used, and the fact that no traces of the fuel find their way to the crank case is further proved by the stiffness of the engine when starting from cold. If the oil became diluted with the fuel this would at once be shown by the freedom of the piston when cold, but the engine "gums up" when Binks spirit has been used to the same extent as when petrol was the fuel.

Both these tests have been backed by more recent observation since adopting the Binks system.

**Tests for Consumption.**

As regards consumption and general efficiency, each comparative test was made over the same stretch of road, a distance of from 20 to 25 miles being covered on each occasion. It may be added that the engine was run at maximum load—that is to say, the total weight carried was as much as any sane individual would think of imposing upon a  $3\frac{1}{2}$  h.p. machine—with apologies to the occupant of the sidecar.

**FIRST TEST, AGAINST STRONG WIND, SEVERAL STIFF GRADIENTS ENCOUNTERED.**

Fuel.	Miles per gal.	Miles per hour.
Shell spirit ...	44½	20.5
Binks XXX fuel ...	51½	18

This test was not considered satisfactory, and since several shorter trials produced similar results, the carburettor was readjusted. Time was still lost when the Binks fuel was used by the necessity for constantly having to retard the firing point, and finally the compression of the engine was reduced by inserting a  $\frac{1}{16}$  in. copper packing between the cylinder and the crank case. This almost cured the knock, and better

**Road Test of Binks Fuel.—**

running was experienced. The following results were then produced:

ORDINARY GOING, NO WIND, DRY ROADS.			
Fuel.	Miles per gal.	Miles per hour.	
Shell spirit ... ..	72.8	27.4	
Binks BXA ... ..	88.	26.4	

LONG UP-GRADES AGAINST STRONG WIND.			
Fuel.	Miles per gal.	Miles per hour.	
Shell ... ..	48.	20.6	
Binks BXA ... ..	60.8	19.8	

No difference was noticeable between the XXX and the BXA, but on all tests taken the Binks fuel produced a better mileage per gallon than petrol at a slight loss of road speed. Mr. Binks states that most standard touring machines prove slightly faster on Binks fuel than on petrol, and this would probably prove to be so in the case of twin-cylinder machines, as the fuel gives a very strong explosion, but in the case of a "single" it is almost impossible to press the engine above a certain road speed.

**Disadvantages of the Fuel.**

What, then, are the disadvantages of the Binks fuel? In the case of a single-cylinder machine the greatest of these is its tendency to enhance the noises

caused by loose bearings, and to create a knock, both due to the suddenness of explosion. This can be reduced by reducing the compression, but if the compression be so far reduced as to effect an absolute cure, the running of the engine would hardly suit the speed merchant.

Secondly, difficulty in starting. Unless the carburetter be quite drained of the heavy fuel, this remains in the bottom of the float chamber, and is difficult to get rid of when attempting to start up on petrol. A tap for draining the pipe and float chamber would be useful. A careful scrutiny must be made for air leaks.

Thirdly, the odour of this fuel is more clinging than that of petrol. A shield over the air intake below the jets would prevent spray from blowing on to the right leg of the rider, and tend towards cleanliness.

Finally, the motor cyclist who adopts this or similar systems must make up his mind that careful adjustments will prove necessary ere the best results can be obtained. With any type of carburetter a hot air intake is desirable, and with single-cylinder machines it will probably prove necessary to reduce the compression. Imperfect carburation should not be allowed to continue, and freedom of exhaust is more necessary than if petrol be the fuel. H.M.B.

## OVERHEATED SPARKING PLUGS.

**D**URING the last six months I have owned two machines which differ in an important respect from their innumerable predecessors. You cannot make their engines "dry up." I don't say that illimitable laps all out on Brooklands might not engender some suspicion of fatigue, but it is simple fact that no sustained speed possible on English roads will cause "that tired feeling" in the engine. One of them is a four-stroke, the other a two-stroke, and they are both colossal "revvers." But this claim is only true of the engines. Every now and then, after a prolonged speed burst, the engine will suddenly pull up, and for some time I blamed the engine in both cases, whereas the real fact was that the electrodes of the sparking plugs had become incandescent, and were causing pre-ignition. I ought to have guessed what was happening, but muddled it out in my usual round-about fashion by an accident, when a sparking plug which I had discarded as useless proved to fire perfectly when cool. I believe that both these engines will overheat any sparking plug on the market, given suitable riding conditions, but the symptoms are naturally most pronounced in the case of plugs with spidery electrodes; the thicker the electrodes, the better they conduct heat, and the slower the plug is to get incandescent. This fact appears to supplement the existing case for bulkier sparking plugs, and a change of standard dimensions. If it ever comes, it will doubtless come slowly; but some authorities have already pleaded that the huge electrical voltages generated in magnetos demand heavier insulation than the present standard plug dimensions can contain. However that may be, it is irritating that two faultless engines should be spoilt for want of a ha'porth of tar, i.e., a plug which can be trusted to keep cool under work which the engine takes smilingly. I am told that the plug-heating propensities of two-strokes have led manufacturers to tackle this matter rather

energetically, and that we may soon get plugs which are to all intents and purposes proof against pre-ignition.

AN ITALIAN RIDER OF A 1916 8 h.p. SUNBEAM.

Signor Gustavo Cuocolo, of Milan, the owner, is an officer in the Italian Royal Engineers, and this is his fourth Sunbeam. He rides it solo, and judging by a recent letter he is highly delighted with its running and hill-climbing.

# "THE MOTOR CYCLE" RECRUITING SECTION.

## Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

## Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

**C**OLONIALS still continue to present themselves for enlistment in the M.M.G.S., one of the latest recruits being Herbert Irons, of Dundee, who, after spending fourteen years as a rancher in the Argentine, paid his own expenses home specially to join this popular branch of the Service.

Several recruits journeyed to the last week's inspections by road. Among them were F. G. Sharp, who rode from Cheltenham to Coventry on his  $3\frac{1}{2}$  h.p. Triumph, and A. B. Hurry, of Cambridge, who came on a  $3\frac{1}{2}$  h.p. Sunbeam. One keen man actually push-cycled from Lichfield to Coventry. A recruit for the armoured car section drove over on his six-cylinder Sunbeam. Several other recruits were owners of cars.

A number of applications for enlistment having been received from Ireland, it is hoped in the near future to make special arrangements for the examination of such candidates before they have to cross the water.

In addition to the inspections of recruits announced last week in Bristol, Manchester, and London, two additional dates have been arranged, viz.:

COVENTRY.—Recruiting Office, Masonic Buildings, Tuesday, May 2nd, 11 a.m. till 4.30 p.m.

NOTTINGHAM.—Recruiting Office, Stamford Street, Wednesday, May 3rd, 2.30 p.m.

On Saturday, the 29th inst., Mr. Geoffrey Smith will be at *The Motor Cycle* offices, 20, Tudor Street, E.C., between 2 and 4.30 p.m. in order to test recruits.

## APPLICATION TO JOIN THE MOTOR MACHINE GUN SERVICE.

Name .....

Address .....

Chest measurement ..... Height .....

Group No. ....

or Age .....

Class No. ....

How long have you been a { motor cyclist? .....  
car driver? .....

Can you execute running repairs? .....

Are you fit for overseas service? .....

Occupation .....

When are you called up? .....

WHAT DATE COULD YOU JOIN? .....

After filling in the above particulars return to:

MR. GEOFFREY SMITH,  
Inspecting Officer,  
19, Hertford Street,  
COVENTRY.

[Issue April 27th, 1916.]

Pte. Maurice Greenwood, A.S.C., a despatch rider and well-known motor cyclist of Todmorden, who is now home on leave.

Numerous applications have been received for transfers to the M.M.G.S., but these cannot be considered unless the application emanates from the candidate's Commanding Officer. Motor cyclists already in the Services should particularly note this announcement.

Motor cyclists and car drivers desiring to enlist should attend one of the inspections arranged, or, failing that, fill up the form on this page, when notification of further arrangements will be made by letter. The following are among recent accepted men:

Barnsby, E. R., Birmingham.  
Bartlett, W. G., Frome.  
Bass, W., Rushden.  
Bassett, H. K., Wolverhampton.  
Beaton, G., Stockton-on-Tees.  
Breeze, H., Eccleshall.  
Cartwright, H. A., Birmingham.  
Chandler, A. T., Small Heath.  
Clark, H. G., Bristol.  
Clutterbuck, Berkeley.  
Copestake, A. E., Marlow.  
Cox, W. R., Eastleigh.  
Cox, W. T., Bristol.  
Crabtree, E. C., Burslem.  
Cutler, W., Sutton Coldfield.

Young, J., Coventry.

## SPECIAL FEATURES

EASTER COMPETITIONS DESCRIBED AND ILLUSTRATED.  
ROAD TEST OF A NEW FUEL. TOP FEED CARBURETTORS.

## TIME TO LIGHT LAMPS

GREENWICH TIME.

Apr. 27th	...	7.43 p.m.
" 29th	...	7.46 "
May 1st	...	7.50 "
" 3rd	...	7.54 "

## Saved from the Deep.

About one hundred drums of petrol, representing some 44,000 gallons, have recently been found off the western coast of Sicily.

## British Machines for France.

Last week the Triumph Cycle Co., Ltd., received another large order from the French Government for 4 h.p. Triumph motor cycles.

## Petrol in Germany.

Owing mainly to the greatly increased price of motor spirit in Germany, the Berlin General Omnibus Co. lost £39,380 during the past year's working.

## Starting Difficulties.

We still receive too many complaints from our readers that their machines are too hard to start. Both the manufacturers of complete motor cycles and also those of carburettors should give this matter more earnest attention.

## Common Spirit.

We recently had to fill the tank of the  $3\frac{1}{2}$  h.p. combination we were driving with a brand of petrol such as is being used in lorries and motor omnibuses, for which we were charged 2s. per gallon. It did not appear to render the engine any more difficult to start, and gave ample power.

## Eastertide Competitions.

There were but two motor cycle events of importance this holiday, and both are described and illustrated in this issue. When the competitors were not clad in khaki, they were either armleteers or medically unfit for service.

## German Motorist Killed.

Dr. Ludwig Opel, who once upon a time made a motor cycle, but whose name during the last few years had been prominently associated with motor cars, has been killed at Verdun.

## The Launceston-Hobart Record.

One of Erwin Baker's many records made in Australia—the full list was published on page 382 of our last issue—has already been lowered. We refer to Baker's time of 2h. 37m. for the 123 miles between Hobart and Launceston, Tasmania. Latest reports are to the effect that E. Bayles on a Harley-Davidson has since covered this route in 2h. 34m. 50s.

## Australian Ten Miles Record.

J. Booth, the well-known Victorian rider, has, we understand, lowered the Australian ten miles road record to 9m. 42s. His mount was a Dunlop-tyred Indian.

## The State of Our Roads.

We wonder how many more converts we have obtained to our Spring Frame Campaign after sampling the road surface this Easter. A number of riders remarked to us quite seriously what would become of pleasure motoring after the war if road surfaces continued to deteriorate. Motor 'buses, heavy lorries (industrial and military), and steam tractors are, of course, responsible, and the curious part is that these are the vehicles which get off with the smallest taxes.

## Motor Cycle Records at Herne Hill Track.

On Good Friday the Southern Counties Cycling Union held the United Services Sports at Herne Hill track. The programme included a special performance by Harry Martin, in which he beat all records from a mile to five miles on a  $3\frac{1}{2}$  h.p. M.A.G.-engined Matchless motor cycle. His time for the five miles was 6m. 2½s., the previous best being 6m. 59½s.

## Don't Motor for Pleasure.

Under this heading, a London evening newspaper has stated that it would have been cheaper and quicker for Mr. Lloyd George to have returned from his brief holiday at Criccieth by train instead of motor car. It states that petrol alone would have cost £2 6s. 6d. for the journey, whereas the railway fare, first-class, is £1 19s. 8d. Personally, we do not blame the Minister of Munitions for getting the maximum of fresh air in a short respite from his hard work, and the stuffy railway carriage is not likely to attract anyone when there are other means of travel available.

## Daylight Saving.

Several Continental countries having decided to put forward an hour all clocks at 11 p.m. on the 30th inst. and put back an hour at 1 a.m. on October 1st, the question of similar measures being adopted in this country is again being revived. A saving of fuel to provide artificial light is advanced as the main reason. Motorists in general, particularly in view of the harassing regulations concerning lighting at night and the danger of driving at all in some districts, would, we have no doubt, welcome a scheme of daylight saving.

## Well-known Competition Rider Married.

We wish to congratulate Mr. G. T. Gray, 2nd Lieut. R.E., on his marriage to Miss M. Ridley. The ceremony took place at Barnet on Thursday last week, and the happy couple left after the reception for the honeymoon by motor. Among the many telegrams of congratulation received after the ceremony was one from Mr. Gray's former section still serving in France. Mr. G. T. Gray will be remembered by many as an enthusiastic competition rider of Rudge motor cycles, on which he gained much success in many of the important trials of pre-war days. At the outbreak of war he joined the 7th Middlesex Regiment, and served for some time in Gibraltar, later transferring to the R.E. as despatch rider, and seeing active service in France, where he had the distinction of being one of the few who were selected to act as motor cycle escort to H.M. the King during his tour of inspection. He now holds a commission, and is engaged instructing D.R.'s at a training centre in England.

BIRMINGHAM M.C.C. TRIAL. A neat and attractive sidecar attached to E. Kickham's  $3\frac{1}{2}$  h.p. Sunbeam. It has a hood, and a celluloid screen can be fitted if desired.

## TRIAL IN THE PEAK DISTRICT.

Sheffield—Another War Munitions Centre—organises a Trial embracing many noted Six Days Trials Hills.

E. Sales (3½ h.p. Sunbeam sidecar) climbing Cowdale. He was subsequently disqualified through missing the course.

**A** RELIABILITY trial, in aid of our wounded soldiers, took place on Easter Monday in Yorkshire and Derbyshire. The principal award was the Wilkin Trophy. In addition to this, one gold medal, one gold centre medal, and one silver medal were given in each class, and a bronze medal to all competitors who finished the whole course within ten minutes of schedule time irrespective of marks lost *en route*. All these were given by Messrs. G. W. Wilkin and Co.

The trial, which was in the hands of Mr. G. W. Wilkin, of Sheffield, was open to munition workers, armleteers, and badged and Service men. It was originally intended to make the entrance fee 10s. 6d., but this was found to be too high and was reduced to 7s. 6d.—still rather on the high side in our opinion, and this undoubtedly accounted for the meagre entry list.

### The Competitors.

The entries were as follow :

- A. Blake (2¼ Levis sc.)
- W. H. Bray (1.9 Levis)
- H. B. Hindley (2½ Levis)
- E. Sneath (2¼ Levis)
- F. W. Varney (2½ Levis)
- A. Charles (2¼ James)
- Sgt. H. M. Pashley (2½ Connaught)
- H. Crozier (7 Indian)
- A. Marshall (4¼ James sc.)
- L. Wilton (3½ Triumph)
- C. C. Brown (2¼ Douglas)
- W. Jackson (5 Indian sc.)
- J. Blackburn (7.9 Pope sc.)
- A. E. Booth (7.9 Harley-Davidson sc.)
- E. Sales (3½ Sunbeam sc.)
- H. Barnisconie (4 Norton)
- J. Hardacre (4¼ B.S.A. sc.)
- S. Guest (3½ Rudge)
- H. Wood (4 Norton sc.)
- E. Hallat (8 Morgan)

Of these, owing to the inclemency of the weather, only eleven started from Hunter's Bar, Sheffield, at 9.30 a.m.,

and they cannot be said to have had a very enjoyable time, for they were faced by wind and driving rain from first to last, and oilskins were the order of the day. This must have been very disappointing, in view of the fine scenery traversed, which could not be appreciated on such a day.

The conditions were not very arduous. Competitors were timed by their own watches, and were allowed ten minutes early or late without losing marks. Passenger machines were obliged to carry a passenger throughout, and the combined weight of passenger and driver had to exceed 18 stone. There was a stop of one and a half hours for lunch at Buxton.

### The Route Traversed.

The route included the following places: Jenkin Hill, Gladstone Road, Dairy Lane, Lodge Lane, Wyoming Brook, Stannington, Dungworth, Lower and Higher Bradfield, Strines, Lady Bower Inn, Bamford, Hathersage, Grindleford, Sir William Hill, Eyam, Foolow, Bradwell, Castleton, Mam Tor, Sparrow Pit, Buxton, Cowdale, Kings-terndale, Millers Dale, Tideswell, Litton Village, Cressbrook, Monsal Dale, Monsal Head, Bakewell, Rowsley, Rowsley Toll Bar, Beeley, Chatsworth Park, Baslow Bridge, Froggatt Edge, Fox House, Dore Moor, and finish at Hunter's Bar.

In spite of the wet some of the performances were very commendable, and hills which caused many failures in the last A.C.U. Trials were ascended with comparative ease. For instance, there

ONE OF MANY WELL-KNOWN HILLS INCLUDED IN THE COURSE.

H. Wood (4 h.p. Norton sidecar) at the top of Sir William.

A. Charles (2 1/4 h.p. James) on Mam Tor.

J. Hardacre (4 h.p. B.S.A. sidecar) coming up Lodge Lane.

was only one failure on Sir William, but it is only fair to state that the stones which previously proved such a stumbling block were gone. Cowdale, a steep winding ascent between Buxton and Bakewell, every competitor succeeded in climbing.

Sgt. H. M. Pashley (formerly of Sheffield, now D.R. with the Canadians) was using O.H.M.S. number plates. The police at a check in the village of Baslow took exception to these, and caused the rider some considerable delay in gleaning information for their report.

#### Striking Performance of Two-strokes.

One of the features of the trial was the excellent climbing ability shown by

the two-stroke machines, which proved to be the winners of each class. The Levis and Connaught machines shared the honours, the first-named mount, driven by Blake, actually taking a sidecar round the whole of the difficult course. A. E. Booth (Harley-Davidson sc.) unfortunately charged the bank of Lodge Lane, owing to his low gear stripping.

Sawdust was used to mark the course at all the difficult corners, but much of this was removed by the wind and obliterated by the rain. This proved to be the undoing of A. Marshall (James sc.), who had been running with the greatest regularity up to Rowsley Toll Bar, where he missed the turn and lost his position, having to be content with

third place. In fact, the absence of a guiding mark caused all the competitors but three to leave the route at this point. As may be imagined, spectators were not numerous owing to the rain, though a few assembled here and there to applaud the more notable performers.

#### Results.

The provisional results are as follow :

##### SIDECAR CLASS.

1. A. Blake (2 3/4 Levis sc.), Wilkin Trophy and gold medal.
2. H. Wood (4 Norton sc.), gold-centre medal.
3. A. Marshall (4 1/4 James sc.), silver medal.

##### SOLO CLASS.

1. Sgt. H. M. Pashley (2 1/2 Connaught), gold medal.
2. A. Charles (2 1/4 James), gold-centre medal.

#### THE TWO WINNERS.

Sgt. H. M. Pashley (2 1/2 h.p. Connaught) first in the solo class.

A. Blake (2 3/4 h.p. Levis sidecar) first in the sidecar class.

## MIDLAND EASTER TRIAL.

Birmingham M.C.C. hold a Successful Event mainly for Service Men and War Workers.  
41 Survivors of 52 Competitors over 146 Miles Course.

### LOOKING UP AND DOWN THE OLD WYCHE CUTTING.

A. Mariani (7 h.p. Powerplus Indian sidecar) making a good ascent.

W. Cooper (7-9 h.p. Harley-Davidson sidecar) nearing the top.

**A**NY competitive event in these days admitting "slackers" would not be tolerated. Thus the Birmingham Motor Cycle Club's annual Easter Monday reliability trial was confined to ladies, Service men, Reserve men, munition workers, and all other war workers, but there were no openings for single men eligible for service. We have no doubt that the organisation of an isolated competition such as this for the genuine workers forms a very welcome respite. It provides something to look forward to, and may fairly be characterised as recreative motoring as opposed to joy riding pure and simple.

At the starting point at Griffin's Hill, Selly Oak, on Monday, one was cheered to note the proportion of khaki-clad competitors, whilst navy blue was not entirely absent. There was the same old starting point for Birmingham club trials, the same old faces of officials, the same starter—what trial could be complete without Alec Ross lining up the men?—but frequently the riders were attired in new guise. Altogether the event provided a happy re-union amid general expressions of hopes that the glorious competition days may soon return.

More than one entrant had tales of woe to relate before the time of the start. Cpl. E. Gray had been granted special leave for this event, but had had the misfortune to break the forks of his Zenith on the way to Birmingham. Another competitor could not find the garage proprietor until a few minutes before starting time, and then, when he finally got his machine, found only

one cylinder firing, so reluctantly withdrew.

Practically all the fifty-eight entrants were sent off at minute intervals from 9 a.m. over the 146 miles course, which, though devoid of "freak" climbs, was sufficiently sporting to promise much weeding before the competitors arrived back in Birmingham.

### An Unpromising Start.

It was drizzling with rain as the riders moved off toward Beacon Hill in the face of a gusty wind blowing from the south-west. The first two or three miles toward Bromsgrove over road surfaces "waved" by motor 'buses were not exactly pleasant. We passed E. R. Troward doing something to his machine—he had complained of a fractured petrol pipe at the start—and later Sec.-Lt. H. R. Davies busy with his back tyre. But eight miles from the start, Beacon Hill accounted for several men, though the gradient was nothing to what was to follow. Edwards (4½ h.p. James sc.), Cpl. Johnson (Norton sc.), and the Rev. J. M. Phillpott (3 h.p. Enfield) were among those who came to a standstill, the ruts and grease troubling them. We then passed Bromsgrove and Worcester with its slippery tramlines, and entered upon the second non-stop section, this naturally embracing the Old Wyche at Malvern. Here several hundred spectators had congregated as usual, and were quick to show their appreciation—or otherwise—of a good or bad performance. It had stopped raining now, and the surface of the hill being in excellent order, the performances, generally speaking, were very good.

### Old Wyche Cutting.

The following are notes on some of the performances:

T. B. Haddock (2½ Diamond), very good.

Rex Mundy (3½ Sunbeam), a steady and good climb.

A. Mariani (7 Indian sc.), quite good.

E. Kibble (4 Triumph), very fast and steady.

Sec.-Lt. Davies (3½ Sunbeam sc.), engine seemed to be very hot and was missing; stopped near top.

G. Kuhn (2½ Levis), very neat climb.

W. Cooper (7 Harley-Davidson), seemed to have rather too high a gear; amused spectators by bouncing in saddle, apparently to prevent wheel slip.

J. R. Alexander (7 Indian sc.), very good climb.

E. Frassetto (7 Indian sc.), probably the fastest climb of the day.

Miss Hough (8 Morgan), excellent climb.

Rev. J. W. Phillpott (3 Enfield), failed on lower stretches.

E. Kickham (3½ Sunbeam sc.) caused a little excitement by having a race on the lower stretches of the hill with D. Moss, on an 8 h.p. Moss-Jap, Kickham eventually getting a lead, and reaching the top corner well in front, having made a very good climb.

N. Brown (7 Indian sc.), very good.

G. F. Ammon (2½ Tyler) ran alongside.

W. Barr (3 Enfield) ran alongside.

D. Alan Poole (4 Norton sc.) stopped within few yards of top.

H. J. Stretton Ward (3½ Rudge), very good climb.

L. Clarke (4½ James sc.) stopped near crest, was pushed, and restarted.

**Midland Easter Trial.—**

G. Bell (7 Harley-Davidson sc.), very good climb indeed; fast and silent.

H. Riddell (3½ Sunbeam sc.), steady climb.

F. J. Cooper (6 Enfield sc.) failed near summit; could not hold machine; let it run back, scattering spectators; eventually came to rest against the wall. This accident was lucky in a way, as there would have been no room for Lt. Messervy (8 Morgan runabout) to pass otherwise. As it was the officer was able to make an excellent ascent.

Lt. H. Naylor (6 A.J.S. sc.) made fast climb, as did also P. G. Tomkins (2½ Douglas).

W. H. Broadfoot (4½ James) stopped but restarted without passenger.

C. Percival (4 Douglas) steady climb.

A. Birch (4 Douglas sc.) fast and silent.

After the Wyche the riders were directed via the British Camp Hotel, having an opportunity of enjoying the magnificent panoramas of the Malvern hills. Dropping back again to the Worcestershire side, the competitors wended their way to within half a mile of Upton-on-Severn, or Severn-on-Upton as a wag put it, bearing in mind the recent floods, and then turned to the right for Gloucester. The roads now being dry and hard, the men had no difficulty in keeping to the 20 m.p.h. schedule, for frequently we passed groups chatting and smoking. Through Upton St. Leonards, Portway Hill (65½ miles),

the next test, was encountered. The roads hereabouts were wet again, and on the hill itself there was a thick covering of grease, which proved more than one competitor's undoing. The gradient in any case is very deceptive. The two fastest climbs were apparently accomplished by Stretton Ward (Rudge) and Coates (8 h.p. Enfield sc.), though Frassetto (Powerplus Indian sc.), with Miss Lottie Berend as passenger, made a wonderful climb, as he did on every test hill we observed.

Birdlip was the last ascent before lunch, and then descending Leckhampton, the riders entered the spacious yard of the Plough Hotel, Cheltenham, where Mr. F. W. Corbett—the A.J.S. expert—had got everything in readiness as

**SNAPS ON SOME OF THE TEST HILLS IN THE BIRMINGHAM M.C.C. SERVICE AND MUNITION WORKERS' TRIAL.**

Two Sunbeam riders on the Wyche Cutting. The solo rider, A. J. Young, got on better than Sec.-Lt. H. R. Davies.

Staff-Sgt. N. H. Brown making a good ascent of Portway on his Powerplus Indian sidecar.

H. Riddell, Sub-Lt. R.N.V.R., driving his 3½ h.p. Sunbeam sidecar up Birdlip.

T. H. Haddock (2½ h.p. Diamond) approaching one of the gulleys on Rising Sun.

SCENES ON PORTWAY, WHERE THERE WERE SOME FAILURES OWING TO THE SLIPPERY SURFACE.

T. Stevens (4½ h.p. James sidecar) being passed by Pte. C. H. Poole (5 h.p. Indian).

C. Naylor (4 h.p. A.J.S. sidecar).

usual. Here we learned that Davies's stop on the Old Wyche was primarily due to a puncture, which caused him to speed up to make up time, and he commenced the climb with a red-hot engine. Two competitors ran out of petrol on Birdlip—Rose (4½ h.p. B.S.A. sc.) and Coates (8 h.p. Sunbeam sc.). The last-named had two spare tins of spirit strapped to his carrier. Barr (3 h.p. Enfield) suffered from wheel slip in making the climb, and he was not the only one. The burly Haddocks, astride a little two-stroke Diamond, went up comfortably, as is his wont. The 4 h.p. Sunbeam sidecar driven by J. E. Greenwood, the Sunbeam designer, showed up conspicuously, as also did Cooper (Harley-Davidson) and J. R. Alexander (Indian sc.). Two Grand Prix Morgans, one driven by Miss Hough being two years old, and the other handled by Lt. H. T. Messervy, made sure ascents. The last-named competitor will be recognised by many readers as late of Duo Cars. Unhappily, since his last appearance in competition he has had his right foot amputated, after being wounded at the Dardanelles by machine gun fire. He handled his Morgan throughout very dexterously. We noticed that it had a water heated induction pipe, and the owner assured us that it had reduced his consumption to nearly 70 m.p.g.

#### The Afternoon Run.

There was quite a crowd to see the competitors restart, motor cyclists predominating. Those who are acquainted with Midland trials will hardly need telling that Rising Sun or Gambles Lane was the first test after lunch. There was the usual crop of failures, intermingled with star ascents, which show up skill in tuning, handling the machine, and selection of gear ratios. Again a crowd took the greatest interest in the proceedings, and appeared thoroughly to enjoy the fare.

#### Rising Sun.

The surface of this hill was in very fair condition, and, with the exception of some nasty ruts at the top, which made

going unpleasant and accounted for one fall, the hill generally was in quite good order. What failures occurred were undoubtedly either due to hot engines or lack of power. The first up was A. J. Dowler (3½ h.p. Sunbeam).

Sgt. A. Milner, who will be remembered by many as a very clever trick rider, amused everyone by bouncing his front wheel high off the ground. His little Levis had no difficulty in climbing the hill.

J. E. Rose (4½ h.p. B.S.A.) came up fast with front stand down, and when within a few yards of the top the stand apparently caught a rut, and caused him to fall.

E. Kibble (4 h.p. Triumph) made a really excellent climb.

A. Mariani (7 h.p. Indian sc.) was steady, but slow compared with the other Indians.

B. W. Harcourt (8 Rex-Jap) failed, and after spending some time making adjustments, eventually was able to restart with assistance and reach the top.

W. Cooper (Harley-Davidson sc.) came to a standstill just below the steepest part, but by slipping his clutch he reached the top in a succession of jerks, being assisted by the onlookers. This was hard luck, as he had an otherwise perfectly clean sheet.

Miss Hough (G.P. Morgan) showed great skill in driving, for when at the steepest part she was balked by a sidecar and had to thread her way through spectators at the side of the road.

E. Frassetto (Indian sc.) again made star ascent. Miss Berend, his passenger, was the only one we noticed to lean in the proper direction on the bend.

G. Bell (Harley-Davidson sc.) made splendid climb.

G. H. Ratcliffe (Norton sc.) and J. E. Greenwood (3½ Sunbeam) came up close together, and as L. Clarke stopped near the top they had rather a difficult time; however, both made clean ascents.

Lt. R. T. Messervy (G.P. Morgan) was fast, and swerved about considerably.

J. N. Hill (6 Bat) was very fast, but

throttled down for hump at top, and was unable to pick up again.

From the summit of Cleeve, Winchcombe was reached, the riders branching off down the inconspicuous alley which leads past Sudeley Castle to the hill of that name. J. E. Rose (4½ h.p. B.S.A.), after suffering a fall on Rising Sun on the loose stones, made amends by climbing Sudeley in excellent style. J. R. Alexander went up at a rare bat on his Powerplus sidecar, the deep ruts not seeming to worry him after his training among the Scottish hills. Miss Hough again drove her Morgan with great skill; this lady seems at home on any kind of motor vehicle—motor bicycle, sidecar, runabout, or car. The Harley-Davidson, driven by W. Cooper, went up the 1 in 6 section as if it were level road. Closely following was G. Kuhn (2½ h.p. Levis), whose pace was noteworthy. Noel Brown's Indian sidecar was satisfied with middle gear till within sight of the crest of the hill. T. Stevens made a good climb on his old James outfit, which we must have seen on Sudeley at least a dozen times in competition. Poole (Indian), Choldcrop (Sunbeam), and Ammon (Tyler) came up in a bunch, whilst Kickham's Sunbeam, which had a very attractive disc wheel torpedo sidecar, emitted a most healthy bark, and there was no mistaking the pace. Poole (4 h.p. Norton sc.) had power in hand. Barr (3 h.p. Enfield) and Thompson (4 h.p. Douglas sc.) came up abreast at a good pace. Perhaps Harcourt's Rex-Jap was the quietest machine of the batch, though the A.J.S. sidecars, particularly Naylor's, were noticeable in this respect. Again Frassetto showed the simplicity of hill-climbing on a well tuned Powerplus.

#### A Coincidence.

A curious incident was twice repeated under our very eyes. R. S. Coates (8 h.p. Sunbeam sc.), whilst travelling splendidly, suddenly dried up. Before the momentum of the machine had subsided, one cylinder chipped in, the competitor touched the ground with his foot, though this could not have helped matters, and away the engine went

The only lady competitor climbing Rising Sun or Gambles Lane. Miss Hough (8 h.p. Morgan) passing a less fortunate competitor near the top.

again. A few minutes later his namesake, T. Coates (8 h.p. Enfield sc.), had reached the same spot "all out" on top gear when apparently his float chamber ran dry. The driver saved himself by changing quickly and dexterous manipulation of the clutch. A two-stroke Connaught ridden by Pte. C. Taylor made a very neat and quiet ascent. Bell's Harley-Davidson sc. "roared up," to use a term beloved of motor cyclists. The Rudge-Multi ridden by Stretton Ward again shot up the test hill, though we noticed his head lamp had been shaken to pieces by the rough roads. Greenwood's Sunbeam, like all the others of this make, showed up conspicuously, but we award the palm to this rider as his mount was the most silent.

Ratcliffe's Norton sidecar was very fast, but the bark—it was ear splitting with the throttle open! Tomkins (2½ Douglas) sped past Naylor's A.J.S. sidecar on the steepest pitch, though the last named was obviously content to maintain his own pace. They were followed by Sub-Lt. Riddell, R.N.V.R., on another 3½ h.p. Sunbeam sidecar, and Lt. Messervy on the G.P. Morgan. A few minutes later Hill's 5-6 h.p. Bat-Jap swept up the hill without the slightest effort. C. Percival drove his Douglas up at the comfortable speed one would expect of a man over military age. The performance was none the less impressive to the observant, however.

### The Result of Large Jets.

During the hill-climbing tests one could not help but notice the misfiring on several machines, due apparently to the use of a very large jet. Sinister (4½ B.S.A. sidecar) went spluttering nearly all the way up Sudeley. Altogether forty-four competitors of the original fifty-two starters passed us on Sudeley Hill.

Thereafter the run home was *via* Fish Hill, Broadway, which troubled nobody, to Mickleton, where there was a time

check to Stratford, Warwick, Kenilworth, and Stonebridge. At the time checks, by the way, one or two competitors had cut things so fine that they literally dashed up to the officials and almost threw their watch cases, narrowly avoiding collisions with machines in the roadway.

The finish was at Hodge Hill Common, and competitors generally voted the event a very successful one and excellently arranged. A few competitors ran off the course, but this is perhaps inevitable on such a long and intricate route.

### Provisional Results.

#### GOLD MEDALS.

A. J. Dawler (3½ Sunbeam)  
A. Milner (2½ Lewis)  
T. B. Haddock (2½ Diamond)  
Rex Mundy (3½ Sunbeam)  
A. Mariani (7 Indian sc.)  
E. W. Choldcroft (3½ Sunbeam)  
J. R. Alexander (7 Indian sc.)  
Noel Brown (7 Indian sc.)  
E. Kickham (5½ Sunbeam sc.)  
T. Stevens (4½ James sc.)  
Pte. C. H. Poole (5 Indian)  
Sgt. C. B. Thompson (4 Douglas sc.)  
C. Naylor (4 A.J.S. sc.)  
E. Frassetto (7 Indian sc.)  
G. Bell (7 Harley-Davidson sc.)  
H. J. Stretton Ward (3½ Rudge)  
Sub-Lt. H. Riddell (3½ Sunbeam sc.)  
Lt. R. T. Messervy (3 Morgan)  
C. Percival (4 Douglas)  
T. Sinister (4½ B.S.A. sc.)

#### FIRST CLASS CERTIFICATES.

W. Heaton (4 A.J.S. sc.)  
W. Cooper (7 Harley-Davidson sc.)  
J. Dudley (3½ Sunbeam)  
R. S. Coates (8 Sunbeam sc.)  
T. Coates (8 Enfield sc.)  
J. E. Greenwood (3½ Sunbeam sc.)  
Lt. H. Naylor (6 A.J.S. sc.)  
P. G. Tomkins (2½ Douglas)

#### SECOND CLASS CERTIFICATES.

J. E. Rose (4½ B.S.A.), G. Kuhn (2½ Lewis), W. D. Hawkes (2½ Tyler), G. F. Ammon (2½ Tyler), D. Alan Poole (4 Norton sc.), W. Barr (3 Enfield), G. H. Ratcliff (4 Norton sc.), L. Clarke (4½ James sc.), J. N. Hill (5 Bat), and A. Birch (4 Douglas).

#### The following retired:

Sec.-Lt. H. R. Davies (3½ Sunbeam sc.), A. J. Young (6 Sunbeam), Cpl. E. Johnson (Douglas), Rev. G. Phillpott (3 Enfield), C. Moss (8 Moss-Jap sc.), R. Troward (4 Triumph), B. W. Harcourt (8 Rex-Jap sc.), Pte. C. Taylor (2½ Connaught), F. H. Cooper (6 Enfield), W. H. Broadfoot (4½ James), and Wells (—).

## BY THE WAY.

There were a dozen service men competing.

Cpl. J. Drew had his leave cancelled, and had to return without competing.

One competitor was using graphite suspended in oil, and was quite enthusiastic about the success of the mixture. It may be marketed before long.

The five Indians entered all gained gold medals.

Some of the competitors seemed quite annoyed to have been "had" by Portway. It looked so easy, but the coating of grease told its tale.

Another rider was using a patent carburettor of new design—which he carefully wrapped up in flannel, *i.e.*, his overalls—before entering the hotel for lunch. Honesty forbade us peeping behind the scenes, though we knew the secret!

We hardly recognised Haddock when he proffered a handshake. He is now clean shaven, and wittily remarked that there had been a "Hair Raid."

The two members of our staff who covered the trial were mounted on military models—a 4 h.p. Triumph, such as supplied to despatch riders, and a Clyno sidecar outfit largely used by the M.M.G.S. Both behaved in an exemplary manner climbing all hills with ease.

A new Humber "after the war" model was driven round the course by S. Wright. It has a 3½ h.p. horizontally opposed twin engine and three-speed countershaft gear box. With a weighted sidecar Sam Wright could develop a surprising turn of speed, and we saw him make very neat climbs of Rising Sun and Sudeley.

A. E. Kibble (4 h.p. Triumph) ran over a dog in Broadway, which caused him to fall and hurt his foot. He was taken into a house, but was able to proceed after resting awhile. He arrived late at the Mickleton check. This was very hard luck, as up to this he had a perfectly clean sheet, and also finished to time. His case is receiving special consideration in consequence.

Miss Hough finished the course, but "took the wrong turning" after Birdlip, which precluded an award.

The water splash near Sudeley was a surprise for many, although it was noted on the route cards. It caused a considerable amount of trouble. Had it been in a non-stop section it would undoubtedly have been the cause of several lost gold medals.

Much interest was displayed in the performances on the famous test hill, the Old Wyche Cutting. The wall and path at the top, where the gradient is the steepest, were crowded with spectators, notably of the weaker (?) sex.

Most of the competitors made excellent climbs, and failures were few.

# THE TAXATION OF MOTOR CYCLES.

Possibility of Owners laying their Machines Aside. A Hint that the Treasury may place the Taxes on a Fairer Basis.

CONSIDERABLE numbers of letters continue to reach us on the taxation question, and on this subject the adage "*quot homines tot sententiae*" no longer holds good, for there is remarkable unanimity of opinion that, under the proposed scheme, motor cyclists are being very unfairly treated. This, as our readers know, we have maintained from the first, and for the following reasons:

1. The R.A.C. or Treasury rating gives no fair comparison of the horse-power of different motor cycles.
2. This rating is still more unfair when comparing motor cycles over 4 h.p. with cars of like horse-power, e.g., a certain 1,000 c.c. car is rated at 6½ h.p., tax £4 4s.; while a certain 500 c.c. motor cycle is rated at 6½ h.p., tax £4 14s. 6d.
3. The Treasury rating is unknown in the motor cycle world, as machines are known by their nominal makers' rating and their capacity.
4. The tax on cars under 16 h.p. is doubled, while the tax on motor cycles, none of which exceed that horse-power, is increased in many cases to nearly five times as much, and is in all cases more than doubled.
5. No difference is made between a sidecar outfit carrying two passengers and a solo mount.
6. No allowance is made in the case of old machines of low value, where it is possible that the tax may amount to nearly half the value of the machine.

But in making representations to the Chancellor, it was necessary to bear in mind that no recommendation was likely to be adopted *which materially decreased the amount of revenue which the Treasury expected to obtain.* Readers who think our suggestion too high should remember this.

We look with no favour upon the scheme put forward by a contemporary which proposes to increase the tax on lightweight motor cycles (i.e., to make the minimum tax on motor cycles £2 10s.), and take it off Auto-wheels. This is, as one of the correspondents puts it, "robbing Peter to pay Paul," and we should like to see the R.A.C. rating altogether discarded as far as motor cycles are concerned, for it is entirely unsuitable, and consequently unfair.

Many of our readers have informed us that the proposed increase of tax will compel them to lay up or part with their mounts. It is not that they are unpatriotic, but the extra tax combined with the increased duty on, and price of, petrol makes it simply impossible.

## Readers' Opinions.

Sir,—There is one marvellous anomaly in the proposed motor cycle taxes, and it is this: For £1 we are allowed to motor from January 1st to August 15th, but for a period three months shorter—April 1st to August 15th—we are to be charged very much more—in my own case nearly five times as much. We were told not to motor for pleasure (health, I call it), accordingly I adopted the Premier's motto, "Wait and see." Result—I have, like many others, been made an "April fool." Why penalise a man for doing what he was told? If we were not to motor, why take out a licence? The £5 or £6 which *would* have gone to the Treasury for my £1 licence and petrol taxes have gone in buying a push bicycle, and I shall have saved another £10 or £12 to pay my income tax. O 346.

Sir,—You appear to assume that all riders will be able to meet a demand for £4 4s. for a big twin, but I have every confidence in stating that there is a majority to whom this will be quite impossible. I refer to the man who has to work for his living, earns an income ranging from £150 to £300 a year, and, I consider, forms the backbone of the body of present-day motor cyclists.

I consider that the maximum taxation a motor cycle can bear is £2 for engines over 500 c.c. and £1 for those below. I suggest that all motor cyclists who can do so should cease to use their machines.

## RIDER OF A BIG TWIN.

Sir,—In regard to the new motor taxation, what would be the tax payable on a 3½ h.p. Douglas? I see from a contemporary that there is some possibility of a revision of

the taxes; but the suggested revision would, if R.A.C. rating be persisted in, operate still more unfairly in the case of the 3½ h.p. Douglas. As at present the tax would be (I suppose) £3 3s., under the revision £4 14s. 6d.—quite ridiculous for a 494 c.c. machine. E. G. SWANN.

[The 3½ h.p. Douglas has a bore of 68 mm., and would be rated at 5.6 h.p. by the R.A.C. formula.—Ed.]

Sir,—In my opinion the most simple and commonsense method of taxation is to double the present tax on all motor cycles, irrespective of h.p., for, after all, the higher-powered machines pay their extra quota on the extra taxed petrol.

Any scheme that compels owners of such motor cycles as the Scott, for instance, to pay £4 14s. 6d. will defeat its own object, and whether Mr. Loughborough's figures of the estimated number of machines at present in use is accurate or not does not matter. What does matter, both to the Treasury and particularly to the trade, is, what will be the number of machines in use after a heavy tax is imposed. A large proportion of motor cyclists are working men of limited means, who manage "by foregoing other pleasures" to buy an old machine. But they are essential to the trade, for few buy new machines unless they can find customers for their old ones. And I maintain that any severe tax will take "the user up" from the ranks of motorists, and both the Treasury and the trade will be worse off for it.

HOLDSWORTH HARDY.

Sir,—As a member of the motor cycling public, kindly allow me to thank you for your letter to the Chancellor of the Exchequer on our behalf. If your excellent suggestions are disregarded, then my machine—and many others—is for sale or storage.

Kindly permit me to put in a plea on behalf of owners of Auto-wheels and auxiliaries. It is a great pity that the new tax should prove the death blow of these very interesting attachments, and I feel sure the old tax of £1 is quite sufficient for them, and that it was too much in normal times. WORKING MAN.

Sir,—Will you permit me as a reader of your valuable paper for some five years to air my views on the taxation question?

In the first place, money has to be found, and I think that we can trust the Government to have some fair reason for increasing the tax other than spitefulness.

Then the question is how would be the fairest way to apportion it? The suggestion of one guinea a wheel, made in your paper, at first glance seemed a good solution, but would come rather hard on 3½ h.p. outfits. Might I suggest the following:

One wheel and cycle attachments up to 1½ h.p.	£1	0	0	
Two wheels up to about 600 c.c. ...	...	2	0	0
Two wheels over 600 c.c. ...	...	2	15	0
Three wheels up to about 600 c.c. ...	...	2	15	0
Three wheels over 600 c.c. ...	...	3	10	0

SCOOTER.

## A.C.U. Secretary's Interview with the Treasury.

The secretary of the Auto Cycle Union has recently had an interview with Sir John Bradbury, the Secretary of the Treasury, with the object of placing before him the injustices motor cyclists would have to suffer through the proposed new method of taxation. Sir John Bradbury listened to Mr. Loughborough's able appeal with extreme sympathy, and while it seems almost too much to hope that the A.C.U.'s proposals, which very nearly agree with our own, would be adopted, there seems to be every likelihood of the matter being settled in a manner which would cause the taxation of motor cyclists to be placed upon a fairer basis.

We announced last week that an acknowledgment from the Chancellor of the Exchequer stated that *The Motor Cycle* proposals of taxing motor cycles by their engine capacity (i.e., 10s. 6d. per 125 c.c.) should receive attention.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### More Air, Less Petrol.

Sir,—I submit a tip for riders of Harley-Davidson machines. On the bottom of the induction pipe I found a boss, which is most convenient for fitting a small tap; the ordinary standard compression tap will do quite well. With this simple fitment it will be found that the machine runs cooler, and also less petrol is consumed. I myself have got 60 m.p.g. and over with a sidecar fitted. It is useful for fast work, as the engine can get the maximum amount of air.

B.F.J.J.

### Derby Groups and the M.T., A.S.C.

Sir,—“Subaltern” is doubtless rather tired of the sort of chat written by “Group 40,” but he cannot be nearly so tired as we are of outbursts like his. By we, I mean men who enlisted in the M.T., A.S.C., before most people realised there was a war on.

I do not propose to argue at length about the rate of pay, but I wonder what “Subaltern” would have done if it was vital to have motor drivers, as it was in the early days of the war, when the M.T. saved the situation more than once during the great retreat, and during the greater advance. Would he have offered eight shillings a week to skilled men, who, in many cases, were earning eight and ten times that amount?

Can he cite a case in civilian or military life, since the world began, of where the worst job has been the best paid, and why is the M.T. chosen as the best job?

If men are to be paid according to the amount of risk run, then those who are employed at the War Office should receive nothing, or perhaps ten shillings every time there is an air raid.

The natural reply is that the men at the War Office are paid according to their responsibilities, and there is the whole point.

Would it be right to pay a man who is entrusted with £800 to £1,000 worth of machinery at the same rate as a man responsible for nothing?

I, as a commander of the repair shops, have an easier time than one of the fitters, therefore I should receive less pay than the latter.

“Subaltern” remarks that the war is not going to be won by men driving motors. True. Nor is it going to be won by the men sitting and fighting in trenches without the aid of the men who drive the motors. Can he have overlooked the wonderful work of the French M.T. at Verdun?

No one is more willing to recognise the hardships of the men in the trenches than the men of the M.T., who are genuine sympathisers, but they do think it unfair that their valuable work at the commencement of the war should be quickly forgotten. They are ready to do it again, and willingly too, although a lot of people delight in thinking them slackers.

I only wish “Subaltern” had been my “mate” on the three ton lorry I drove in the early days, and then he would have learnt enough to have made him hesitate before writing as he did.

Regarding the Group question, your correspondent, “Ex-South African Volunteer,” explains it so well that any attempt on my part would be akin “to painting the lily.”

ANOTHER SUBALTERN.

Sir,—I do not agree with “Anglo-Indian’s” remarks regarding the 6s. per day men of the M.T., A.S.C. Is “Anglo-Indian” aware that men who joined shortly after the outbreak of war received 6s. per day, not for the risk they ran (which is nearly nil), but for their services as motor drivers of three years’ experience? Why is there such ill-feeling by the Derby group men against the 6s. a day M.T. driver? Surely they could have obtained it if they had enlisted at the proper time, as many could have done who are now under Lord Derby’s group system, many for the M.T., A.S.C. But, alas, they are too late for the much-coveted 6s. a day, so I suppose that this is the cause.

SIX BOB A DAY.

### Aluminium Pistons for Two-strokes.

Sir,—Permit us to support Dr. A. M. Low’s letter *re* the above, in which he says that the greatest care is necessary to ensure that the exact composition of the aluminium is known when purchased. Very few alloys are really suitable for this severe service, and we believe that we have in Magnalite, made by the Walker M. Levett Co., of New York, whom we represent, the best material for this purpose without exception. Anyway, we have opinions to this effect, after extensive trial of this and other materials, from the Brotherhood Co., of Peterborough, and the Sunbeam Co., of Wolverhampton, and the physical properties possessed by this alloy are given as the result of tests made by Dr. C. F. McKenna, of New York, and confirmed by tests made by the Westinghouse Electric and Manufacturing Co., of Pittsburg, and by the H. H. Franklin Manufacturing Co., of Syracuse.

They are as follow:

	Magnalite.	Cast iron.
Specific gravity ...	2.59	7.218
Weight per cu. ft. 161.5 lb.		450.08 lb.
Thermal conductivity ...	92.0	11.9
Tensile strength ...	25,400 lb. per sq. in.	16,500 lb. per sq. in.
Coefficient of expansion ...	.0000225	.0000056
Elastic limit ...	15,800	—
Compression strength ...	128,000	90,000

If, therefore, an absolutely reliable piston material is required it will be found in Magnalite.

With regard to the Shaw motor attachment, as we have had numerous enquiries from your readers for it, we are afraid that, unless individual purchasers can show that the outfit is intended to be used for other than “pleasure purposes,” we cannot obtain permission to import; but we would like to say in regard to the last paragraph in your notice—namely, “that an ordinary cycle ridden at 35 m.p.h. without spring forks would not be particularly pleasant”—that, whilst we quite admit this, we submit that a man who buys an attachment such as this for fitting to an ordinary cycle would do so not with the idea necessarily of going fast, but of being able to travel at a little beyond the maximum pedalling without effort on his part, and to be able to surmount hills readily, and the Shaw attachment enables him to accomplish the former, running on half throttle, or less, and has ample reserve of power to take any hill at a good speed by opening out the engine.

BRAMCO., LTD.,

F. M. WHATELEY.

### A Board of Selection.

Sir,—I feel inclined to question Cpl. Shaw's statement that this tethering of the front fork spring allows the spring full play. The fork in question absorbs horizontal wheel shocks most efficiently. Unfortunately, horizontal shocks are not the most important enemies the front forks of a motor bicycle have to absorb. A board of selection has been a crying necessity. Machines of several makes are being sent out that would never be passed. Only the other day I scrutinised a batch of new mounts. The detail work, necessary detail work, was shocking. The brakes fitted to a machine on which possibly a man's life depended would have been a disgrace on a child's toy tricycle.

"When the boys come home" there will be a story to tell, and some people's ears will tingle, and very probably their bank account will show a curious leakage. They have asked for it.

ALEX. LINDSAY,

(H.S. Cambria.)

Capt., R.A.M.C.

### A Small Fitting for Indians.

Sir,—The enclosed is a sketch of a pilot throttle valve for fitting to Indian motor cycles. The object of the fitting is to regulate the supply of mixture passed to the engine *via* the pilot jet. In starting an Indian motor cycle fitted with one of these pilot throttle valves, the milled screw is given one or two turns in order to open the valve, the main throttle being closed, of course. The engine is then started up in the usual way, and will be found to run quite slowly at first. As the engine becomes warm, however, it will be found that it commences to "race" unnecessarily.

By screwing down the pilot valve the engine can be throttled down to a mere "tick over." The advantages of this fitting are obvious: (1) Less petrol consumed; (2) slow running, enabling one to crawl along with the standard gear ratios; (3) less noise; and (4) a better braking effect when the main throttle is shut. The valve will be made in two sizes, suitable for the 5 h.p. and 7 h.p. model Indians. It is very easily fitted, simply being soldered into the induction pipe. This fitting is fully protected, and will be put on the market very shortly.

Suggestion for throttling pilot jet on Indian. See letter on this page from Malcolm Brechin.

MALCOLM BRECHIN.

### Two-stroke Design.

Sir,—As the two-stroke motor cycle engine still seems to attract a great deal of interest, may an amateur be allowed to give his views founded on two years' riding experience?

(1.) Port Design. It is frequently stated in your columns that the efficiency of these engines depends largely on correct port design, but I have never seen any mention of what is correct port design. Now, I believe, the ports are always made rectangular, and, no doubt, this shape gives the largest possible opening without making them too deep in a vertical direction, and they must be kept narrow in this direction so that they can be rapidly covered and uncovered by the rise and fall of the piston. When decarbonising an engine the corners of the exhaust port are invariably found to be filled up with deposit, making the opening oval, and it has occurred to me that the ports might, with advantage, be made oval in the first place, not only to prevent this deposit, but because these corners obviously cause a "back-water" which must hinder the rapid flow of the gases. In practice also the engine runs better when slightly carbonised, which, I think, is due to the rounding off of these worse-than-useless corners. The ports would be further improved by having their edges bevelled off instead of being left sharp. Possibly some enterprising manufacturer will carry all before him by bringing out an engine with "streamline" ports.

(2.) Position of Ports. The usual arrangement of ports is—exhaust in front, transfer behind, and inlet at the side. In a few engines the inlet port is directly under the exhaust, and this seems to be the ideal position, as the incoming charge gets warmed by the exhaust.

(3.) Spark Timing. The timing given for two-strokes is dead on top with the ignition fully retarded. Earlier timing gives much better results, but variable ignition is a *sine qua non* for slow running and to prevent knocking.

P. W. HAMPTON.

### Four-cylinder Motor Cycles.

Sir,—Those who, like myself, have since the accumulator days ridden every type of motor cycle, single and twin, large and small, two-stroke and four-stroke, and whose opportunities do not confine them to any one mount for a particular period, must have welcomed your recent references to the subject of four-cylinder motor cycles. To express my own views would expand this letter into an article, so I will confine myself to a few comments, prompted by riding experience of a 5 h.p. F.N., which I have altered and improved almost beyond recognition.

It appears to be assumed that a four-cylinder of much less than 1,000 c.c. is a failure because of frictional losses. I cannot agree. It must be remembered that as against any extra frictional loss in a four-cylinder of 500 c.c. as compared with a single of the same capacity one must place the gain of perfect balance in the multi-cylinder. The lack of balance in a single absorbs a great deal of efficiency. This, taken in conjunction with the fact that in the four-cylinder the stroke is much smaller and consequently the frictional area lessened in ratio, would, I think, show a very slight discrepancy of actual power absorbed, were it possible to conduct a reliable bench test of the two types. I believe I am correct in saying that the F.N. Co. produced in 1914 a four-cylinder engine of 498 c.c., which developed 11 h.p. on bench test. The war, of course, put an end to all experiments.

As regards the question of wheelbase, "Ixon" has evidently forgotten the position of the gear box on the 5 h.p. F.N. when he gives the four-cylinder designer the option of elongating the wheelbase by fitting a countershaft gear or of incorporating a hub gear. The hub is the last place on earth to place a gear, but what objection can be taken to its inclusion as part of the shaft drive, as is done on the 5 h.p. F.N. On the 7 h.p. F.N. it occupies the usual conventional position, and that machine undoubtedly is lengthy and essentially a sidecar machine. In this connection, again, the war has prevented the F.N. Co. from keeping abreast, as I believe the chief designer of that company had evolved a 7 h.p. model preserving all the characteristics of the present machine and yet coming out fully 7 in. shorter in the wheelbase. The Henderson Co. contend that an ultra-long wheelbase makes for unusually comfortable riding. From actual experience, I concur in this view, and I was surprised the other day when having occasion to traverse a bumpy stretch of Lancashire pot-holes, firstly on a spring frame machine and afterwards on a four-cylinder rigid mount, I found the long wheelbase of the rigid machine to be a better comfort-giver in actual practice than the spring frame on the short machine. However, convention demands a short wheelbase, and it is but a simple engineering proposition to meet the demand. I might mention that the gear box on the shaft possesses the advantages of a direct drive and a straight pull on the operating mechanism.

There is a tremendous field open to the British manufacturer in the designing of a four-cylinder motor cycle following British ideas. I do not wish to make invidious comparisons between the Henderson and the F.N. Each has its talking points, but neither make is all it might be made by a British manufacturer. Even so, I should not dream of going back to a single or a twin for a permanency. That within a very few years the ideal double-purpose mount will be a 500 c.c. three-speed four-cylinder is the conclusion I have reached after experiments on an old F.N. to which had been attached a temporary arrangement for operating the inlet valves mechanically. I think the results would have astounded those advocates of medium weight singles and twins who talk so glibly of frictional losses, when all the time they are led astray by an induction system that is the greatest blemish on an otherwise beautiful job.

H. E. THOMPSON.

**Top Feed Carburetters.**

Sir,—With reference to the comments made by "Ixion" re top v. bottom feed to the float chamber, to our minds there is no comparison between the two. The only point that we are aware of where the bottom feed float chamber can be said to score is that it is possible to remove the float from the float chamber while it is in position without disturbing the petrol pipe.

Directly against this you have the fact that if the bottom feed float chamber is subject to excessive vibration the cap may work loose and become partly unscrewed. We have an instance on record where this caused a very serious fire. This, of course, is impossible in the case of the top feed, as the float chamber cap is locked permanently into position by means of the petrol pipe. Roughly speaking, the following are the advantages of the top feed v. bottom feed:

**TOP FEED.**

The life of the needle valve is considerably lengthened owing to the absence of the balance weights.

The cap cannot become loose by vibration.

When flooded to start the petrol level in the float chamber is not raised, and the flooding is over immediately the tickler is released.

Elimination of the balance weights with their tendency to jam when unduly worn.

Cannot be assembled wrongly.

Air locks are apt to take place in any float chamber if there are excessive bends in the petrol pipe, or if the petrol pipe is too small in diameter, or if the petrol pipe takes, in any part of its course, a horizontal position.

Dirt coming through the petrol pipe is swept away from the needle seat and falls to the bottom of the float chamber out of the way.

With reference to choking of filter gauzes, this is equal in both types, provided the same gauze is fitted. The riders have the option of removing the gauze, but if the dirt is allowed to come through the carburetter, sooner or later the jet is found to be choked up, and if it only becomes partially choked this generally causes trouble, which an amateur may have difficulty in finding. The real cure for the thing is, of course, to fit a proper filter gauze of ample area between the tap and the carburetter, as invariably new machines have a certain amount of dirt left in the tanks, and it is some considerable time before this is eliminated.

With regard to altering the petrol level with the top feed, this is set once and for all. We may say that many troubles are caused by riders tampering with the needle, which is never necessary. As a matter of fact, the petrol level can be down the jet as much as a quarter of an inch, or even more, without being in the slightest way perceptible under the lightest loads under which it is possible to run the engine. Therefore, the idea which many people have of having to keep the petrol just level with the top of the jet is a fallacy.

**BOTTOM FEED.**

The hammering effect of the balance weights causes undue wear upon the point of the needle where it seats.

The cap sometimes becomes loose, and unscrews by vibration, causing excessive flooding.

When flooded to start the petrol level in the float chamber is raised, and flooding continues until such time as the surplus is drained away.

Wear and tear of the balance weights and pins tends to cause them to lock and flood. This is practically universal if the float chamber has been in wear for any excessive period.

Amateur efforts often bend the balance weights or their pins, consequently causing stiffness in working, and flooding.

The same remarks apply to the bottom feed.

Dirt coming through the seating remains there, as this is the lowest part of the float chamber, and tends to cause flooding.

We may say that with the ordinary sized jet that is fitted to most carburetters capillary action alone will account for quite a quarter of an inch difference in the indicated level of the jet and the true level of the float chamber. That is to say, when the petrol level will show level with the top of the jet, the level in the float chamber is a quarter of an inch lower, this provided the jet has once been wet with petrol.

With reference to the liability of the float chamber lid to turn when a spanner is being applied to the petrol union, provided each is tightened up with the same amount of pressure, there is no fear of the float chamber lid coming undone while undoing the petrol union, as the diameter of the thread in one case is approximately 2in., and in the other case is approximately 3in., the frictional resistance of the float chamber lid being far in excess of that of the nut.

BROWN AND BARLOW, LTD.,

C. BROWN, Managing Director.

**Floatless Carburetters.**

Sir,—With regard to the letter on floatless carburetters in your paper of March 23rd, I quite agree with "Old Hand" that it is possible to produce a floatless carburetter suitable for a motor cycle engine. A floatless carburetter named the Blocktube—used largely on the 90 h.p. Le Rhone

(See accompanying letter from G. W. Hepple.)

rotary aero engine—gives satisfactory results. A screwdown cock is required to regulate the flow of petrol, so that the engine will give the maximum number of revs. on full throttle. It is then possible to accelerate or shut down by opening or closing throttle. I enclose with this note a rough sketch.

G. W. HEPPLÉ, CPL., R.F.C.

B.E.F.

**Overheating on Two-strokes.**

Sir,—I think that some of your readers will find the following interesting as regards my 2½ h.p. two-speed Connaught two-stroke.

I live in rather a hilly district and where road conditions are very bad indeed. Consequently I rather doubted as to whether my Connaught would be able to face it; but I am astounded at the reserve of power to be found in the engine and the strength of the frame. It is nothing unusual for me to roar up some really big hills on top gear. I have not yet failed on any hill, and have frequently taken a passenger.

The carburetter is an Amac, and I am now using a 24 jet, consequently the consumption is good, averaging from 95-100 m.p.g. on Shell No. 1 when obtainable.

I must say I like the petroil lubrication as far as lubrication itself goes, but it is very messy. I can go for miles on a low gear—9 to 1—with the engine going fairly fast, without, as "Ixion" says, "the thermometers in the whole country going up 10° apiece." I will admit that the Levis lubrication system is ideal, but will G. W. Wilkin state what is his oil consumption? Of course, if he keeps his engine "swimming in oil," as he must do, what can he expect but a cool one? How often does he decarbonise? I decarbonised after 2,000 miles, and found rather a big deposit.

Has any Connaught rider tried paraffin; if so, with what results? My machine has a fair turn of speed, 43 m.p.h. being the fastest.

R 2199.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Carburettor Flooding.

**?** Will you please advise me as to what to do with my carburettor (B. and B.), which leaks under the jet when the engine is stationary, but not when it is in motion? I have cleaned it thoroughly, and cannot see that the float sticks.—F.R.H.

The trouble is probably due to the needle valve not seating properly, caused by grit on the seating, to the valve requiring to be ground in, to a bent needle, or to the float being full of petrol owing to a slight leak. The toggle levers being worn or sticking might also cause the petrol level to rise too high.

### Overhead Valves.

**?** When ordering an 8 h.p. engined motor cycle for general use, both solo and with sidecar, what is the disadvantage in specifying overhead valves? The advantages are obvious, namely increased speed and liveliness. Would an overhead valved engine be difficult to start, wear out quickly, refuse to run slowly, be difficult to take down for the purpose of grinding in the valves, or overheat with a sidecar? I should be obliged if you would inform me whether you consider that the advantages of this type of engine outweigh its disadvantages?—E.W.H.

The great disadvantage of overhead valves is the risk of the valve breaking and falling into the cylinder. An engine with overhead valves would not be difficult to start, but the moving parts are likely to wear quickly unless proper means are taken to lubricate them. It would run slowly if there is an absence of air leaks, and the carburettor is adjusted properly. A good many of these engines require the cylinder to be taken off for the valve to be ground in. Such a procedure, while not difficult, entails much unnecessary labour, and occupies double the time required on a side-by-side valve engine. There is no reason why these engines should overheat; in fact, the reverse is what is to be expected. On the whole, we think that an overhead valve engine is not worth using for touring purposes, the side-by-side valve being, generally speaking, superior except in the case of a motor cycle used for speed purposes only.

### Engine Balance.

**?** The vibration of my engine at speeds over twenty miles an hour is excessive, and on taking down the engine I find the counterbalance which is cast on the flywheels is heavy enough to bring the two pistons to the top of the stroke. I have always understood that all the revolving weight and about half the reciprocating weight should be balanced, so that the counterbalance appears to be far too heavy at present. Should I reduce the weight to half the weight of two pistons or half of one?—R.J.B.

It is usual to balance all rotating parts, that is crank pin, big end, and half the connecting rod, while half the weight of the reciprocating parts is allowed. These include small ends, half the connecting rods, and both pistons. We would advise you to obtain the booklet dealing with this subject, price 7d. post free from these offices.

### Running on Paraffin.

**?** I recently noticed that one of your readers stated that he ran on a mixture of 50% petrol and 50% paraffin for sidecar work and found it quite satisfactory. I have a 1913 B. and B. carburettor on a 3½ h.p. motor cycle which I run with a heavy sidecar which is always attached. Do you think that I can use the above mixture without suffering from dirty valves and cylinder, also fouling exhaust extension pipe, which is about 5ft. long? The mean temperature here is about 80°. The fastest time I can do on the machine without passenger is 36 m.p.h. I have a three-speed countershaft gear box, and the weight of the machine, sidecar, and rider is roughly 500 lb. Do you consider this a fair speed for the machine (which is chain-driven) on the level?—W.S.R.H., Sarawak, Borneo.

You may find a better mixture to be one-third paraffin and the rest petrol. If you use too much paraffin you are liable to get trouble from dirty valves through imperfect combustion. Of course, in a warm climate you may be able to increase the proportion of paraffin to petrol slightly. We think 36 m.p.h. is quite as much as you can expect from this machine with a sidecar.

### Failure of Drip Feed.

**?** I have a drip-feed lubricator fitted to my motor bicycle and sidecar, which acts properly when the machine is stationary, but after I have been two or three miles the oil remains in the barrel and is churned into a froth, and it is not until the machine has been brought to a standstill for about ten minutes that the oil in the barrel finds its way into the oil pipe leading to the engine. The lubricator is new, and water-cooled oil is always used. If you could suggest a remedy I should feel much obliged.—W.A.R.

The cause of your trouble is undoubtedly due to the non-return valve, which should be fitted at the crank case end of the oil feed pipe, getting out of order, the ball or small metal disc having become stuck or failing to close properly owing to grit on the seating, the result being that the crank case pressure forces the oil back up the pipe into the lubricator. Thoroughly clean the non-return valve, and make sure there are no air leaks at any of the joints in the system.

### Refusal to Fire.

**?** I should be much obliged if you will help me out of my little difficulty with a twin Moto-Rève. I cannot get it to fire. The compression is good, and the engine gets the mixture all right. The magneto gives a good spark, even at low speeds, with the plug out. There is some sparking at the contact breaker. Can the magneto give a good spark with the plug out and not under compression? If so, what is the probable reason, for the spark in air is five-sixteenths of an inch long, and the plugs sound?—R.A.

The trouble may well be due to a defective inlet valve, the spring being too weak, or the valve being stuck up, for under these circumstances the magneto would give a good spark and yet the engine would not fire. If the magneto give a good spark with the plug on the cylinder, it is likely that the plug would fire all right under compression. See that there are no air leaks at the carburettor or induction pipe unions. It is possible under certain circumstances for the plug to fire in air but not under compression.

### PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER,

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always buying their copies from the same place, if possible or by giving a definite order to a newsagent for the regular supply of the journal each week.

**Age for Driving Licence.**

?

Would you kindly tell me the age one has to be to obtain a driving licence? At the Post Office they say they think it is seventeen years. I noticed recently in *The Motor Cycle* a young correspondent saying that he is going to get a motor cycle when he is fourteen years old.—L.B.

A licence to drive a motor cycle only may be obtained at the age of fourteen, but to drive a car the age limit is seventeen.

**Auxiliary Radiators.**

?

I should be glad if you would tell me whether you consider auxiliary radiators would be of assistance to me, and whether they could be fitted to an Enfield twin. My engine runs reasonably cool as long as the temperature keeps within reasonable limits, say 75° to 85°, but a "hot westerly" in the bush fire season sends it up to anything from 105° to 115° in the shade. I then find my machine gets very hot indeed, and at times seems to be almost red hot.—J.S.W. (Dudley, New South Wales).

Although you would undoubtedly find auxiliary cooling devices of assistance, we think there must be something wrong with the adjustment of your machine to cause such great overheating; even in spite of the high temperature, the machine should not get so hot as it apparently does. We would advise you to make sure you are not using too large a jet, also that the valve tappet clearance is correct, viz., not more than .4 mm. Also make certain the silencer gives no back pressure, and see that your engine is receiving plenty of lubrication. We think you will have no difficulty in fitting any of the auxiliary radiators at present on the market.

**Tuning Up.**

?

Which is the best setting of the plug points and contact breaker in order to pick up quickly on coming to a hill after turning a corner? I ride a 2½ h.p. twin two-speed model. Is it better to raise the exhaust lever when taking a corner, or to drive on the throttle and open out quickly? There are one or two hills in this district where my machine fails after taking a corner, and cause me to drop down to low gear, and I am unable to change up again into high until the level ground is again reached. In lubricating, is it necessary to have the exhaust on the smoky side? I have seen a machine with an Amac carburetter, where an extra air inlet (in the form of a compression tap) has been screwed in the centre of the induction pipe. Is that any assistance towards more power? I, of course, go round the engine for air leaks, and test carefully with oil.—E.H.

The plug points should be set to a distance of about  $\frac{1}{16}$  in. apart. It is better to close the throttle when slowing down at a corner. The reason you fail is because your machine is probably a little out of tune. You should overhaul the engine, and see that all the ordinary adjustments are correct, such as the valve springs, tappet clearance, and

so on. This should not be greater than .4 mm. at most. No; it is only necessary to have your engine smoking when it is working under a very heavy load, such as being driven all out or going up a long hill. Blue smoke shows that the machine is getting a little too much oil. There is no harm in your having a compression tap in the intake pipe if it is perfectly gastight and also the joint where it screws in; it might prove of use in hot weather.

**Loss of Power.**

?

A few months ago I bought a single-cylinder motor cycle, 1909 pattern. I have had it thoroughly overhauled, but can get little power from it. The piston and cylinder are clean, and the compression is good. There does not appear to be any air leakage, as I have bound all the joints with adhesive tape. When I bought the machine the air inlet to the carburetter was partly closed by a cork. This I removed. The jet appears to have been enlarged, and is now decidedly large. I have made the choke much smaller by inserting a piece of tubing in the carburetter so that the air space round the jet is now one-eighth of an inch all round. I thought that the smaller choke would increase the velocity of the air round the jet and give a better mixture. The machine will carry me for a few hundred yards (after giving trouble in starting), and then gets weaker and weaker until it stops. Would you advise me to buy a new carburetter or to look elsewhere for the source of my trouble?—H.E.W.

H. V. Norton, the leading West Australian rider, who is about to come home to serve the Mother Country. Practically every race meeting in Perth or any part of W.A. has resulted in Norton on a Sunbeam carrying off premier honours, and his most recent success was that of running second in the W.A. 150 miles Tourist Trophy race last October. It is expected that he will ride a Sunbeam in the next Isle of Man T.T.

It is difficult to say what is wrong with your machine from the details which you give, but everything points to the trouble being due to the carburetter. If this is a very out-of-date model it would perhaps be an advantage to fit one of a more modern pattern. The choke you are using at present seems exceptionally small, and no doubt the mixture is altogether too rich. See that the valves are seating properly, and that the springs are sufficiently strong.

**READER'S REPLY.**

In answer to "H.J.M." in *The Motor Cycle* of January 6th, I had a similar loss of power under practically the same conditions. I overhauled the engine; everything all right. On restarting it was all right for a few weeks, after which it started losing power again. By accident I opened the oil drain tap and put in some new oil, and it simply roared away. As soon as ever it started failing next time, I just opened the drain and it was all right again. I trust this may be of use to your readers, and wishing you every success with your paper.—J.A. (Bradwall, F.M.S.)

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.K.W.R." (Warwick).—2½ h.p. two-stroke Excelsior for solo and sidcar work.

"Q.M.S." (Norwich).—De Luxe T.D.C. two-stroke. Reliability, speed, consumption, and ease of control.

### A Manchester Appointment.

Mr. E. Woods, whose name will be familiar to many Lancashire motor cyclists, has been appointed manager of the W. and H. Motor Co., Ltd., of 287, Deansgate, Manchester. The firm has the sole agencies for several makes of motor cycles and light cars.

### A British Magneto Guarantee.

Attention may be drawn to the very generous guarantee arranged by the Electric Ignition Co. (1913), Ltd., regarding the E.I.C. magneto. The guarantee has been made retrospective, and it covers every one of the 11,000 magnetos made by the company since August, 1914. This is conclusive evidence that the manufacturers of these magnetos have the utmost confidence in their goods.

### A Business Change.

T. Lester Jones informs us that he has purchased the business of Messrs. Bell and Smart, who have lately gone into liquidation. A new company is at present in formation, and will shortly be registered as Messrs. Bell and Smart, Ltd., 48-50, Tottenham Street, W.

### A Useful Enamel.

We are in receipt of a sample of Robbialac, the well-known preparation for painting and tonching up motor bicycle frames. If properly applied it gives a good finish, which closely approximates stoving. Together with the tin and brush has been sent us a sample of a dozen different colours in which Robbialac is supplied for enamelling motor cycles. It is made by Messrs. Jenson and Nicholson, Ltd., Stratford, E.

### Catalogues Received.

The Royal Ruby, a well-illustrated catalogue in which are described the lightweight models, two and four strokes, suitable for either lady or gentleman riders. The Royal Ruby Cycle Co., Ltd., Cannel Street, Ancoats, Manchester.

"The Brooks Book of Saddles, Bags, etc., for Cycles and Motor Cycles." This is the 1916 Brooks catalogue, and, needless to say, it is well produced, dealing as it does with articles of such good repute. At present J. B. Brooks and Co. are engaged on Government work, and extensions have been made to the factory.

We are in receipt of Proctor's Useful Tables. Edward Le Bas and Co., Dock House, Billiter Street, E.C. 6d. A useful little publication giving tables of metric weights and measures and the English equivalent, discounts from 2½% to 97%.

Avon Tyres—Motor Cycle and Cycle Section, 1916. The Avon India Rubber Co., Ltd., 19, Newman Street, Oxford Street, W. A comprehensive and well-illustrated catalogue, a glance through which impresses one with the completeness of the Avon range. The works are at Melksham, Wilts.

We have received the latest catalogue issued by the Stepney Spare Motor Wheel, Ltd., Stepney Works, Llanely, S. Wales. The chief items therein of interest to motor cyclists are the two types of Stepney motor cycle tyres, the Stepney Road Grip tyre, which is an efficient all-rubber non-skid; and another type for machines up to 3½ h.p. The tread is provided with ribs at the sides and rubber studs in the centre.

### The Public Schools Hill Climb.

There were some good performances at the Public Schools hill-climb, reported in our last issue, but attention may be drawn to the remarkably good showing made by J. V. Prestwich, Harrow, whose mount was a 2½ h.p. Calthorpe-Jap. He secured first place on formula in his class and fourth fastest time of the day.

### Reviews.

"Instruction Book on Operation, Care, and Adjustment of Indian Motor Cycles." With the great majority of motor cycle manufacturers engaged on munitions, the chances of a private owner having his machine overhauled at its birthplace are rather remote. Recognising this, the Hendee Manufacturing Co. have issued a new instruction booklet to facilitate the merest novice carrying out repairs and adjustments for which in peace times the machine would probably be sent to a garage or factory. This latest Indian booklet is certainly very complete, written in plain language, and well illustrated.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable
A.B.C.	1915	3½ 4-speed	£63	—

## ELITE RUBBER Co., Ltd.,

266, Vauxhall Bridge Rd., Victoria, S.W.

Phone: Victoria 6553.

One Minute Victoria Station.

In answering this advertisement it is desirable to mention "The Motor Cycle."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

## Henderson.

**HENDERSON** 4-cyl. Motor Cycle, £85 nett; early delivery; deferred terms from one-quarter down, balance by twelve monthly instalments. Clients purchasing motor cycles from us can practise on the private road and test hill alongside these premises before venturing out into the West End traffic, this being the only London garage in the West End possessing this facility, and also being the only London garage that is totally homegrown. We garage Henderson motor cycles for 1½ per week, and in the event of your being called to the colours, we will store same, pending your return, for the nominal sum of 1/- per month.—Messrs. Green Taxis, Villiers St. Garage, Charing Cross, London. [4058]

# JUNO MOTOR CYCLES ARE THE VERY BEST

Sergt-Major J. BENNETT, Upavon, Wilts, writes under date 28/3/16:

"I am pleased in every way with my **JUNO V.T.S.** motor. It has given me not the slightest trouble the whole twelve months I have run it, approximately 10,000 miles. The bearings are good as new, no shake anywhere."

This is only one of many testimonials as to the high quality of the "**JUNOS**."

**JUNO**, 2½ h.p., £29 10s., or £6 deposit and 41/8 month.

" 2-speed, £36, or £7 8s. deposit and 51/- month.

" V.T.S., £30 10s., or £6 4s. deposit and 43/- month.

" 2-speed, £37, or £7 16s. deposit and 52/- month.

" 4 h.p., £62 15s., or £16 deposit and 83/4 month.

" 6 h.p., £75 12s., or £16 10s. deposit and 105/- month.

All carriage paid.

## SIDECARS.

MATCHLESS-J.A.P. 1913 Combination, 8-h.p., 2-speed, Amac carburetter, double belt drive, 2 new Pedley belts, new Hutellinson tyres, Cowey speedometer, P. and H. lamp, excellent condition, very fast and powerful; owner at Front; arrange trial; price, 60 gns.—Dr. Packman, Rochester. [4474]

## Minerva.

MINERVA, 3 1/2 h.p., U.H. mag., running order; £14.—Coldecutt, Chapel Lane, Wilmslow. [X8338]

MINERVA, 2 1/2 h.p., lightweight, Amac, overhauled; £5, offer.—87, New Park Rd., Brixton. [4301]

MINERVA, 3 1/2 h.p. and sidecar, B.S.A. frame, B. and B. and lin. Whittle belt, good condition; £12.—69, Belgrave Rd., Walthamstow, E. [4499]

MINERVA, m.o.v., Amac, footboards, adjustable pulley, spring forks, Michelin, K.T. mag., very fast and reliable, would deliver machine within 50 miles; price £12/15, no offers.—James, 14, School Lane, Leyland. [4203]

## Motosacoche.

2 1/2 h.p. 1913 Motosacoche, variable gear, perfect order; £12.—Solter, Dry Sandford, Abingdon. [4477]

1915 3 1/2 h.p. Motosacoche and sidecar, lighting set, 2 speeds, kick starter, new condition; £50.—84, Greenside Rd., Croydon. [4204]

MOTOSACOCHE, in good condition; 8 gns., great bargain.—Julian's, Broad St., Reading. Biggest motor cycle and light car dealers in the South. 'Phone: 1024. [X557]

MOTOSACOCHE, 2 1/2 h.p., 1913, Multi gear, free engine, in excellent order, Whittle belt, Bosch mag., good tyres; any trial; approval, deposit; must sell; £15.—J. Coe, Gardiner, Cherrington Rd., Cambridge. [X7981]

## New Hudson.

NEW Hudson, 1912 1/2, 4-h.p., 3-speed clutch, excellent condition; price £23.—Spranklin, Acre Lane, S.W. [4413]

1916 New Hudson, 2-strokes, three model C's in stock.—D. J. Shepherd and Co., Enfield Highway. [4390]

NEW Hudson, 1915, 2-stroke, hardly soiled, single speed; bargain, £25.—Elce and Co., 15-16, Bishnongate Av., Camomile St., E.C. [0598]

1915 2 1/2 h.p. 2-stroke 2-speed New Hudson, machine and tyres in excellent condition; £26.—Lt. Bacher, Royal Flying Corps, Telford, Norfolk. [X8257]

NEW Hudson, 2-stroke, 3-speed countershaft, 1915, £28/10, two lamps and generators, born; Velocette, 2-speed countershaft, 24, lamps, horn.—Box 351, c/o The Motor Cycle. [X8274]

## MOTOR CYCLES FOR SALE.

## New Hudson.

NEW Hudson, 1915, 2½ h.p., single-cyl., 2-stroke lightweight, countershaft 2-speed, lamps, horn, spares, condition as new; £35.—The Premier Motor Co., Aston Rd., Birmingham. [4468]

NEW Hudson 3½ h.p. Combination, 1912, 3 speeds, Mark VI, perfect order, lamps, speedometer, horn, h.b.c. clutch, new tyres; £32/10.—Duffield, 70, Abington Av., Northampton. [X7875]

NEW Hudson Combination, big six, 1916 model, done 1,000 miles, 3 spare tyres and tubes (new), spare chain, belt, and valve, 3 lamps, storm cover, mat, petrol carrier, extra set of tools, and Klaxon horn; bargain, £75, cost £107.—Sergeant-Major Petch, Royal Flying Corps, Shoreham-by-Sea. [4232]

## New Imperial.

NEW Imperial-Jap, 1916 models in stock; £38 and £44/8.—Crow Bros., Guildford. [3967]

IMPERIAL-J.A.P., 1915, 2 speeds, lamps, etc.; £25.—11, Luna Rd., Woodville Rd., Thornton Heath. [4518]

NEW Imperial, light tourist, immediate delivery; cash or easy terms.—Referee Cycle Co., 332, High Holborn. 10765

1915 New Imperial-Jap, 2-speed, accessories; 26 gns.—Troward, Heathurst, Vale of Health, Hampstead. [4485]

NEW Imperial, 2½ h.p., December, 1915, 2-speed, perfect, unscratched; 26 gns.—32, Comeragh Rd., West Kensington. [4478]

1915½ New Imperial, 2½ h.p., J.A.P. engine, 2 speeds, Miller lamp, set, etc., splendid condition; 25 gns.—Alfred Proctor, Chesham. [X7919]

1915½ New Imperial-Jap, not ridden last 6 months, excellent condition, engine better than new; £28.—Brodey, 88, Clements Rd., East Ham. [4193]

NEW Imperials, latest models in stock; 2-speed, also kick-starter hand-controlled clutch models.—P. J. Evans, John Bright St., Birmingham. [4509]

1916 New Imperial, 2½ h.p., J.A.P., 2 speeds, E.I.C. variable mag., actually in stock, £37/18; one other, done 20 miles, £35/10.—Alfred Proctor, Chesham. [X7920]

NEW Imperial-Jap, 2½ h.p., 2-speed, variable ignition, £38; also 2-speed, with clutch, and kick-starter, £44/8; actually in stock; easy payments 2% only extra.—Wm. Whiteley, Ltd., Queen's Rd., London, W. [4505]

## New Ryder.

1915 2½ h.p. Ryder, J.A.P. 2-speed, and accessories; £25.—223, High Rd., Kilburn. [4224]

NEW Ryder-Jap, 2½ h.p., 2-speed, ridden 80 miles; cost with accessories £38 accept 27 gns.—Troward, Heathurst, Vale of Health, Hampstead. [4486]

## Norton.

NORTONS in Stock.—All models for immediate delivery, including latest T.T. model with countershaft gear, De Luxe combinations, and H.R.S., also T.T. models.—P. J. Evans, John Bright St., Birmingham. [4515]

NORTON Motor Cycles from £52/10 to £85; early delivery; deferred terms from one-quarter down, balance by twelve monthly instalments. Clients purchasing motor cycles from us can practise on the private road and test hill alongside these premises before venturing out into the West End traffic, this being the only London garage in the West End possessing this facility, and also being the only London garage that is totally bomb-proof. We garage Norton motor cycles for 1/- per week, and in the event of your being called to the colours, we will store same, pending your return, for the nominal sum of 1/- per month.—Messrs. Green Taxis, Villiers St. Garage, Charing Cross, London. [4059]

## N.S.U.

1912 2½ h.p. Twin, N.S.U. undergeared pulley, o.h.v., perfect condition; £16, offers.—Ginns, Carlton, Carlisle. [4196]

6 h.p. N.S.U., new, 2-speed gear, Cowey speedometer, P. and H. lamps, spring forks, coachbuilt sidecar, in good condition; £23/10.—26, Balfour Rd., Dover. [4426]

## N.U.T.

N.U.T., 2½ h.p., T.T. model, very late 1915, brand new; list price £68/9, offered for £65 cash; easy payments 2% only extra.—Wm. Whiteley, Ltd., Queen's Rd., London, W. [4506]

## Omega.

OMEGA, 3 h.p., Oct., 1915, 2-stroke, 2 speeds, speedometer, lamps, horn, condition as new; £30, or near offer.—3, Carson Rd., W. Dulwich. [4235]

OMEGA 2-stroke Motor Cycles, £31/10 to £31/16; early delivery; deferred terms from one-quarter down, balance by 12 monthly instalments. Clients purchasing motor cycles from us can practise on the private road and test hill alongside these premises before venturing out into the West End traffic, this being the only London garage in the West End possessing this facility, and also being the only London garage that is totally bomb-proof. We garage Omega motor cycles for 1/- per week, and in the event of your being called to the colours, we will store same, pending your return, for the nominal sum of 1/- per month.—Messrs. Green Taxis, Villiers St. Garage, Charing Cross, London. [4056]

## NEW MODELS.

Delivery from stock of the following:  
INDIAN, B.S.A., ZENITH, GALTHORPE,  
RADCO, ALLON, ROYAL ENFIELD.

Shop-soiled Prices, but Brand New 1915 machines:  
GALTHORPE, 2½ h.p., 2-speed ..... £34  
NEW IMPERIALS, 2½ h.p. .... £35, £34, £30  
J.H., 6 h.p., 3-speed countershaft ..... £72

## SECOND-HAND GUARANTEED MACHINES.

1915 3 h.p. LINCOLN-ELK .....	£27
1915 2½ h.p. VELOCETTE, 2-stroke, 2-speed, chain drive .....	£28
1913 4 h.p. BRADBURY, 2-speed, accessories £28	
1915 2½ h.p. NEW IMPERIAL, 2-speed, variable ignition, accessories .....	£32
1913 3½ h.p. SCOTT .....	£38
Or with coach-built Sidecar .....	£45
1913 3½ h.p. P. & M., 2-speed, Arrow coach- built Sidecar, and accessories .....	£42
1915 7 h.p. INDIAN road racer, khaki colour .....	£45
1915 2½ h.p. DOUGLAS, 3-speed .....	£45
1915 3½ h.p. HUMBER, 3-speed, kick starter .....	£48
Or with Millford coach-built Sidecar .....	£59
1914 7 h.p. INDIAN, 2-speed, horn, electrically equipped, and speedometer .....	£48
1915 7 h.p. INDIAN road racer .....	£52
1915 7 h.p. INDIAN road racer .....	£52
1914 7 h.p. HENDEE Special, 2-speed gear, electrically equipped .....	£55
Or with coach-built Sidecar .....	£70
1915 5 h.p. INDIAN, 3-sp., lamp, generator, and horn .....	£56
1915 5 h.p. INDIAN, 3-sp., kick starter, and Spartan horn .....	£58
1915 7 h.p. INDIAN, 3-speed, kick starter .....	£60
Or with coach-built Sidecar .....	£78
1915 7 h.p. INDIAN, 3-speed, kick starter, electrically equipped, and speedometer .....	£64
1915 7 h.p. INDIAN, 3-sp., kick starter, and Indian coach-built Sidecar .....	£75
1915 7 h.p. MATCHLESS, M.A.G. engine, 3-speed gear, kick starter, and Matchless coach-built Sidecar, complete with Lucas dynamo set .....	£85
1916 7 h.p. INDIAN, 3-speed, kick starter, semi-T.T. bars, Lucas electric lamps, Corbin-Brown speedometer, and brand new Bramble Sidecar .....	£90

## MOTOR CYCLES FOR SALE.

## O.K.

O.K., 2½ h.p., 1915, 2-speed, perfect; bargain, £25.—Simpson, Chemist, Ilstock. [X7739]

O.K., 1915 Junior, been 500 miles, 2 speeds; £26.—65a, Rosendale Rd., Dulwich. [X7972]

1915 O.K., 2½ h.p., mark VI. model 2-speed gear, countershaft, tyres engine excellent, as new; £26/10.—Robinson's Garage, Green St., Cambridge. [4440]

## P. and M.

1911 P. and M., 2-speed; bargain, must sell, £20.—8, Mayfield Place, Eastbourne. [4251]

P. and M., Montgomery, everything guaranteed; giving up; £30.—20, Rozel Rd., Clapham. [4273]

PHILON-MOORE 1914½ Combination, run 1,000 miles, equal new; £52/10.—Steven's, Goxhill, Lincs. [X7892]

P. and M., 1913, 2-speed, new condition, and coach-built sidecar; £38, bargain.—29, St. Leonard's St., Bow, E. Seen any time. [4280]

3½ h.p. P. and M., overhauled, take sidecar anywhere, £30, bargain, £30; N.S.U. gear, new, £6/6.—Rowland Dakin, Wombwell, Yorks. [X7891]

P. and M., 1914, 3½ h.p., 2 speeds, clutch and starter, exceptionally good condition; £38.—P. J. Evans, John Bright St., Birmingham. [X8319]

1914 3½ h.p. P. and M., 2-speed, wicker sidecar, in perfect condition; cash or easy terms; £47/10.—R. E. Jones (Garages), Ltd., Swansea. [0721]

## Precision.

PRECISION, 3½ h.p. Combination, 3-speed, clutch; £35.—Stanley, 30, Canterbury Rd., Kilburn. [4230]

## Premier.

PREMIER, 3½ h.p., 3 speeds clutch, late model, fine machine; £25.—Speelchay, 45, Church Rd., Acton. [X3360]

1912 3½ h.p. Premier, free engine, 2-speed, good condition; £23, or near offer.—172, Whipplendell Rd., Watford. [4333]

LATE 1915 Premier, 3½ h.p., 3-speed countershaft, only run 150 miles, not even shop-soiled; sacrifice £53, or exchange 4 h.p. A.J.S., 1916.—Howard, Stationer, Bawtry. [4219]

3½ h.p. Premier, 1914, 3 speeds, coachbuilt sidecar; 32 owner in B.E.F. since August, 1914; running order, little used; £50.—Box L1,258, c/o The Motor Cycle. [4388]

PREMIER, 1914, 3½ h.p., 2-speed countershaft, 1915 coach sidecar, handle starter, lamps, and horn, all new tyres; belt, cylinder, piston, engine sprocket, and chain; £45.—Box 278, c/o The Motor Cycle. [X6868]

## Quadrant.

QUADRANT Combination, latest 1916 model, in stock; immediate delivery; exchange.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [4397]

## Radco.

NEW Radco, 2½ h.p., 2-stroke, Palmer tyres; £25.—188, High Rd., Ilford. [X0751]

RADCO, 2½ h.p., 2-stroke lightweight, 24in. wheels, Palmer tyres, brand new machine, cash £25, or deposit £7/10 and 12 payments of 33/4.—Juno Showrooms, 248, Bishopsgate, London. [4382]

## Rex.

REX, 1910, good running order, lamps; £11/5.—Wilson, 72, High St., Ilstock, Leicester. [X7966]

3½ h.p. Rex, 2-speed gear, Bosch, spring forks, £12; 2 sidecar, £2; offers.—49, High St., Kingston. [X8104]

REX, late 1913, twin, 6 h.p., 2-speed, free engine, coachbuilt sidecar.—Stone, 158, Shaftesbury Av., London, W.C. [4267]

5 h.p. Rex, 2-speed, free engine, handle start, Mills-Fulford wicker sidecar; 21 gns.—90, Albion Rd., Stoke Newington. [4245]

1912 6 h.p. Twin Rex, handle start, splendid condition; £18, bargain.—29, St. Leonard's St., Bow, E. Seen any time. [4281]

1913 6 h.p. Rex, 2 speeds, free engine, and sidecar, perfect running order; £27.—Seen at 335, Bethnal Green Rd., N.E. [4206]

REX, 5 h.p., and sidecar, mag., B.S.A. free engine, handle start, in good running order; £20.—Box 333, c/o The Motor Cycle. [X7918]

1914 Rex, 6 h.p., 2-speed, free, new 3in. Stelastic tyres, £20 sidecar, machine hardly used, spares; £43.—29, Morley Rd., Leyton. [4412]

REX Sidetta, 6 h.p., 1913, 2-speed, lamp, generator, tyres new condition, good running order; £33.—Lyon Garage, Emberton, Newport Pagnell. (D) [X8253]

REX, 5 h.p., 2 speeds, free engine, Bosch mag., good condition; must be sold; £22, or nearest offer.—J. Richards, 62, Tower Bridge Rd., London, S.E. [4328]

EASTER Egg.—Rex, 5 h.p. twin, and sidecar, Bosch mag., Senspray, in really nice order throughout; quick sale £16/10.—3, The Mews, Victoria Rd., Clapham, S.W. [4252]

## The Upkeep of the Roads.

THE House of Lords recently added a most commendable clause to the Local Government (Emergency Provisions) Bill to the effect that no new routes for motor omnibuses and other vehicles of a like nature should be opened up except with the consent of the Local Government Board or the local authorities. The object is to obtain contributions from these very destructive vehicles towards the maintenance of the roads over which they propose to run; for it gives to the local authorities the power of making some arrangement with the omnibus company for the payment of a fair contribution for the upkeep of the roads. It is not intended that the new clause should interfere in any way with commercial vehicles, but to such as ply for hire—omnibuses, charrs-à-bancs, stage coaches, waggonettes, etc.—nor will it affect those vehicles which are running at present.

It seems reasonable that heavy vehicles of this nature, which do a very considerable amount of damage to the roads, and also take up a large amount of room, should do their part in maintaining the roads in fair condition. Already municipal authorities are paying a small rate per omnibus-mile for the privilege of running their motor omnibuses outside their own district, and on the Great West Road, London, under the Middlesex C.C., the same conditions apply.

The tax on motor omnibuses is relatively small, and the companies obtain a rebate on the petrol tax and pay a special price for their petrol. Therefore, we think, they have no cause for complaint if they are compelled to do something towards the repair of the roads which they destroy so rapidly.

While on the subject of motor omnibuses *et hoc genus omne*, we should like to enquire why it is that, when motorists are being urged by placard and otherwise to abstain from pleasure motoring, these vehicles are still making pleasure trips in all directions—to race meetings, for example, and all-day pleasure jaunts. It may

be urged that the worker is entitled to a trip in the fresh air—granted, but if he be the owner of a motor cycle he can obtain it at less cost on his own machine than in a public conveyance.

## Engine Balance.

A SUBJECT of paramount importance which has not had sufficient expert attention devoted to it is the question of the balance of engines. That this is so is all the more surprising as a single-cylinder engine, which is the most common type used on motor cycles, can never be perfectly balanced, and consequently the nearest approach to that desideratum should always be sought after. In this issue we commence a series of very practical articles on the subject of engine balance, to which we direct notice. The problem is a complex one admittedly, but one incentive to devote attention to more perfectly balanced prime movers is the rapidly deteriorating state of our roads. Spring frames will do a lot to minimise road vibration, but with the finest spring frame ever produced an imperfectly balanced engine will cause an objectionable tremor to the rider's hands, feet, and backbone.

As proof that much good can accrue from a complete examination of the question, one may naturally cite the fact that certain makes of single-cylinder engines on the market to-day will turn over at widely varying speeds with an absence of tremor to the handle-bars and saddle, whereas others set every part of the machine dithering, and at certain critical speeds convey to the rider's wrists a rapid series of vibrations akin to an alternating current battery. This excessive vibration is neither good for the machines nor the riders, as, apart from the important factor of discomfort, it shakes loose every fitting on the machines, and in course of time leads to fractured petrol pipes, leaky tanks, broken frames, or other similar troubles. Happily such engines are in the minority, but they do exist, as we know full well.

BY

LXION

### Motor Attachments.

Mr. J. E. Smith evidently overlooks the fact that I paid a tribute to his J.E.S. motor attachment a year or two ago. But he rather gives away the point of his present complaint when he premises that the front forks of a push bicycle should be strengthened before fitting one of his engines, and, further, that the push bicycle should be at least of "medium" quality. I have no criticisms to offer of honest manufacturers who advise their clients to strengthen the forks of push bicycles and to pay a price which is compatible with decent materials and workmanship. Dishonesty begins when vendors assert either that their attachment will be satisfactory when it is not and cannot be; or when they say that any push bicycle will be safe with an engine attached to it. Mr. Smith has not committed either of these misdemeanours.

### Clutch Control Design.

I don't know whether Mr. Batten and myself are fundamentally opposed, or whether he has never sampled some of the truly abominable handle-bar clutch controls which it has been my miserable fate to ride in journalistic tests. Anyhow, he plumps for h.b. control, good if possible, but bad in preference to a pedal. My secret preference is for the dual control, when obtainable; failing that, a good h.b. control; failing that, a pedal control. (Please notice, readers, how we are progressing; it is barely three years since I took a pedal clutch control which walked round the down tube whenever you put your toe on it as quite a natural and pardonable occurrence!) My present heavyweight has interconnected h.b. and pedal control. I find I always use the h.b. control for starting purposes, and eke for the freak stunts of which Mr. Batten writes, but I always use the pedal for gear changing. You can operate either control with no more force than resides in a (rather middle-aged) little finger.

### Jack of All Trades.

For a Government department to tackle the taxation of a highly specialised industry and pastime is about as foolish as it would be for the Triumph people to consult me about getting an extra 2 h.p. out of their standard engine dimensions. But one fails to hear that the Exchequer people have called in any expert advice prior to framing their new taxes. It would surely be the simplest thing in the world for a Chancellor to summon a small committee of motor cycle experts, including designers, importers, financiers, and, above all, journalists, who have no reason to be anything but impartial as between one type and another, or between imports and home-made stuff. Such a committee could be given its terms of reference. For example, "to prepare a scheme which

shall (a), reduce motor cycling by 50% for the duration of the war, (b) prevent highly paid munition workers from squandering their earnings, (c) raise £100,000 for the Exchequer by December 31st, 1916, (d) fall as fairly as possible on all the taxpayers involved, (e) penalise British manufacturers as lightly as possible, (f) reduce or stop imports, (g) impose no arbitrary handicaps on the technical items of design." I write, of course, in entire ignorance as to the exact motives which dominated the Chancellor in his recent proposals, and I am perfectly willing to suppose that revenue was his one and only consideration. But I cannot believe that any genuinely qualified persons were consulted in the framing of the new imposts; and for an outside observer to manipulate our highly complex conditions without blundering would be as great a miracle as for me to revivify an insolvent poultry farm. Germany's efficiency may be overrated in many ways, but at least the Germans do not hesitate to employ specialists wherever there is the least chance that a specialist may emphasise facts which a layman could easily overlook. I hope that after the war the whole question of motor taxation will be revised after due reference to an advisory committee of men thoroughly conversant with its technical, financial, and other aspects. The main effect of the motor cycle taxes will be to administer an artificial and arbitrary stimulus to small single-cylinder engines, and as hard facts were already booming these engines, I don't know that the stimulus will be wholly bad. This is parallel to a similar process in the car world, where the already precocious light car is now undergoing intensive culture, under the dual influences of dear petrol and high taxation. In both spheres alike, the ultra-efficient engine of small cubical capacity is being "forced," as a gardener would put it; in both spheres many surprised users of other types suffer hardship.

### Average Speed.

I see a correspondent invites me to declare my notions on the vexed question of what average speed is possible on British roads. It is useless to cite personal opinions, but he should take the End-to-end record as a standard test. It covers a distance of roughly 900 miles, including some first-class speed stretches, but also many miles of bad going, and more miles of roads where the surface may be good, but the conditions are all against sustained speed. In spite of these adverse factors, the existing record stands at well over 30 m.p.h. In addition it must be remembered that the time is gross, not nett; it includes every conceivable kind of stoppage, and is registered by a rider who is inevitably far below par by the time his job is done. To my mind the record proves that a first-class rider who is fresh and well mounted can

**Occasional Commens.—**

easily average over 40 m.p.h. on selected roads for a short distance. It is perfectly safe and easy for any decent rider to average 30-35 m.p.h. over any decent roads in century trips. Shoals of men do it through the bulk of the average Six Days Trial course, and wait for half an hour or so outside controls until minimum time is up. I should say that the average fast riding motor cyclist keeps going at from thirty to thirty-two miles an hour on ordinary country roads; that the maintenance of a 30-32 m.p.h. gross average implies a strain which nobody ordinarily faces in pleasure riding; but that a good rider, if he were put to it, could maintain a *gross* average of 40 m.p.h. over decent roads without very great trouble. In touring work a gross average of 25 m.p.h. over a full summer day's run is probably as fast as is often achieved.

**For Example.**

Disbelief in the possibility of high averages is usually voiced by men whose machines are slow on hills, or

pick up badly. I am at present riding a machine which will do 40 m.p.h. anywhere, and if I suffered from the speed craze my average speed would be limited only by my willingness to take risks. It will do 40 m.p.h. on second gear up really bad hills; it will do 40 m.p.h. on third speed up moderately bad hills; and it will do 40 m.p.h. on fourth speed up gentle slopes. I could come very near a 40 m.p.h. average with this machine over good roads without ever exceeding 40 m.p.h. on the straight flat; and as the engine is good for 65 m.p.h. on the level, it is obviously child's play to beat a 40 m.p.h. average on this mount, provided one is fool enough to take certain risks, which I am not (at least, not in the ordinary way). Broadly speaking, I regard a 40 m.p.h. average as easily possible, but as clean against all common-sense; but it is only possible to a crack rider, who has a really first-class engine in perfect tune, and who knows how to make the best use of his lower gears, and is willing to take risks.

**EASTER MONDAY'S RELAXATION FOR SERVICE MEN AND MUNITION WORKERS.**

Scenes in the Birmingham M.C.C. Trial, reported in our last issue.

T. B. Haddock (2½ h.p. Diamond) among the chimney pots on the Old Wyche.

Manual exercise on Portway.  
W. Heaton (4 h.p. A.J.S. sidecar) near Worcester.

By H. ADDISON, B.Sc., A.M.I.C.E.

SO much has been written on the subject of balancing motor cycle engines that it might be thought difficult to offer any further useful information on the question. Indeed, the writer hardly expects that what he has to say will add materially to the *practical* knowledge of the motor cyclist; the object of the present articles is rather to give a more or less scientific explanation of facts already pretty generally known, in the hope that a treatment of the subject on these lines will not be unwelcome to readers who wish to know the why and wherefore of everything connected with their pastime.

It has been felt, too, that the interesting discussions on this topic which arise from time to time in these pages receive little notice from the average reader on account of the forbidding-looking terms with which they bristle—"obliquity of the connecting rod," "unbalanced secondary force," and so on. As a matter of fact, there is nothing very formidable about such expressions; no profound knowledge of mathematics or applied mechanics is required in order to understand them, and, provided "commonsense" proofs and methods be accepted in place of rigid scientific ones, the whole subject can be quite simply explained.

### Rotating and Reciprocating Parts

The moving parts which have to be balanced are, of course, the piston, connecting rod, and crankshaft.

The piston, with its rings and gudgeon pin, has a purely reciprocating motion; the flywheels, crankshaft, etc., have solely a rotary motion; while the connecting rod partakes of both kinds of movement. For most practical purposes, however, the small end and upper half of the body of the rod may be regarded as reciprocating, while the big end and the lower half of the rod may be looked upon as rotating. Reducing the problem to its simplest form, then, we have to deal with one moving mass, which we will represent by *W*, travelling up and down along a path equal in length to the stroke of the engine, and with a second mass *M* revolving in a circle whose diameter is equal to the stroke (see fig. 1).

As a rule there is no difficulty in completely balancing the rotating mass *M*; all that is required is

to provide a balance weight diametrically opposite to the crank pin. If this weight is of the correct size, and is fixed at the proper radius, the centrifugal force exerted on it will exactly neutralise the centrifugal force set up in the revolving mass *M*, hence no disturbing effects tending to produce vibration can be transmitted to the motor cycle frame. We can, therefore, at once pass on to a much more troublesome problem.

### Balancing the Reciprocating Parts.

During the first half of each stroke the reciprocating mass *W* has to be started from rest and quickly accelerated, until at about mid-stroke its velocity is equal to the linear velocity of the crank pin; then it must be retarded so as to bring it to rest again at the end of the stroke. A rough calculation will show how rapidly these changes take place. In an engine running at 1,800 r.p.m., and having a stroke of 3 in. (76 mm.), the speed at which the piston moves along the cylinder at mid-stroke is sixteen miles per hour, and this speed is attained in 120th of a second after starting from rest. A motor cyclist would consider he was accelerating pretty smartly if his machine reached this velocity within, say, three or four whole seconds after a standing start.

In order to produce acceleration or retardation in the motion of a mass of matter, *i.e.*, to change its velocity, its inertia must be overcome by the application of a definite external force. Inertia simply means laziness; a body at rest tends to remain at rest—it is too lazy or inert to move of its own accord, and can only be set in motion by being pulled or pushed in the required direction. Similarly, when a body has acquired velocity, it is reluctant to come to a standstill; its speed can only be decreased or increased by the application of force. Naturally the greater the weight of the body, the greater will be the force that is required to effect this change of velocity, and an increase or decrease in the acceleration or retardation (*i.e.*, in the *rate of change* of velocity) can only be brought about by a corresponding increment or diminution in the external force.

Fig. 1.

**The Mechanics of Balancing.—**

We have, therefore, to regard the moving mass  $W$  as offering a definite resistance to any change in its velocity; thus, when the velocity is increased during the first part of the down-stroke, the mass tends to "hang back," and so calls into play an *upward* force proportional to the acceleration. During the latter half of the down stroke the piston, by reason of the high velocity it acquired at mid-stroke, endeavours to descend into the crank case, and, as it is prevented from doing so, it exerts a *downward* force. This downward force continues during the first half of the up-stroke, for then the inertia of the reciprocating parts is opposing the upward acceleration that is impressed on them; while for the remainder of the up-stroke the parts press upward in their effort to maintain the velocity they attained at mid-stroke. To sum up, we see that during the upper half of each revolution an upward force is at work, tending to lift the motor cycle bodily off the ground, while during the lower half a downward force comes into play; it is, of course, the rapid alternation of these forces which produces that vibration which it is the object of balancing to minimise or eliminate.

**Obliquity of the Connecting Rod.**

In dealing with the force due to the inertia of the reciprocating parts, known as the "inertia force" or "acceleration pressure," the problem can be simplified if we temporarily neglect the obliquity (or angularity) of the connecting rod and assume the engine to have a rod of infinite length. Now, what exactly is meant by this term "obliquity of the connecting rod"? A glance at fig. 2 (ii.) should make the matter clear. When the crank is at position (1), and the piston is at the top of its stroke ( $a$ ), the connecting rod is parallel to, and in fact coincident with, the centre line of the engine. As the crank moves to position (2), and the piston to position ( $b$ ), the rod takes up an angle with the centre line, the angle increasing until the crank is horizontal; then the angularity diminishes until the rod again becomes parallel with its original position. This varying angularity has a perceptible disturbing effect on the inertia force, and so it is convenient to assume for the moment that the engine has an "infinitely long rod," in which case the effect would disappear, as the rod would always remain absolutely parallel to the centre line.

Unfortunately such a rod is a little too long to be represented on a diagram, so in fig. 2 (i.) a rod of finite length is shown, on the assumption that it moves parallel to itself; the motion of the piston will then be exactly the same as if the rod were of infinite length. Thus, when the crank successively occupies the positions 1, 2, 3, 4, and 5, the small end of the rod is imagined to move from  $a$  to  $B$ ,  $C$ ,  $d$ , and  $E$ , and the corresponding positions of the piston are  $a$ ,  $b$ ,  $c$ ,  $d$ , and  $e$ .

**How the Inertia Force Varies.**

In fig. 2 (i.) forces acting in an upward direction are laid off horizontally to the left, while downward forces are measured to the right. Commencing at the top of the stroke, the inertia force is represented by the length  $aa_1$ ; as the piston descends, the inertia force uniformly decreases—for example, at ( $b$ ) it has the value  $bb_1$ , until at mid-stroke ( $c$ ) the pressure is zero. During the remainder of the stroke the inertia force acts downwards, and increases uniformly in intensity until, at the bottom of the stroke ( $d$ ), it has the same value as at the top, i.e.,  $dd_1 = aa_1$ . On the up-stroke the sequence of operations is reversed—the downward inertia force decreases from  $dd_1$  at position ( $d$ ) to  $ee_1$  at position ( $e$ ), and to zero at ( $c$ ), after which it changes to an upward force, and increases again to its original value  $aa_1$ . As has been said, the forces represented in fig. 2 (i.) are only those which would theoretically be generated if the engine had an infinitely long rod; they are termed the "primary" inertia forces.

**Influence of the Connecting Rod.**

Hitherto we have assumed that when the crank is at, say, position (2), the corresponding position of the piston would be at ( $b$ ) (fig. 2 (i.)). Considering now the true state of affairs, and swinging the rod across into its actual position, we find that really the position of the piston is at ( $g$ ) and not at ( $b$ ). Similarly for position (5), on swinging the rod along the arc  $Ef$ , it is found that actually the piston is at ( $f$ ) instead of at ( $e$ ). The same reasoning holds good for other positions, and we can therefore say that if the obliquity of the rod is taken into account, the piston is always *lower* for a given crank position than would be the case were the angularity neglected.

Fig. 2.

### The Mechanics of Balancing.—

The effect of this on the inertia force can be immediately deduced. With an infinitely long rod, during the period of time taken by the crank pin to travel from (1) to (2), the piston moves from (a) to (b). Actually, however, taking the obliquity into account, the distance moved is from (a) to (g) (fig. 2 (i.)), that is, the piston moves a *greater* distance in the *same* time. Since in each case the piston starts from rest, manifestly the average acceleration must be greater in the second case than in the first. On the other hand, the true distance traversed on the up stroke while the crank pin travels from (4) to (5) is *df* as against *de*, hence, the actual acceleration during this period will be less than its theoretical value. In short, then, it can be said with certainty that the effect of the obliquity of the rod will be to *increase* the inertia force during the upper part of the stroke, and to *diminish* it towards the lower end.

This is clearly demonstrated in fig. 2 (ii.), which is the true inertia force diagram for an engine having a connecting rod equal to four crank lengths. In this case (a), (b), (c), etc., represent the *real* positions of the pistons for the positions 1, 2, 3, etc., of the crank pin. Comparison with fig. 2 (i.) shows that the maximum upward inertia force has increased from  $aa_1$  to  $aa_{11}$ , while the maximum downward force has decreased from  $dd_1$  to  $dd_{11}$ .

### Primary and Secondary Forces.

The amount by which the true inertia force at any moment differs from the theoretical or primary force is termed the "secondary" force. That is to say, we may regard the reciprocating mass *W* as being acted upon by two forces, a "primary" force and a "secondary" force; but it should be noted that this is an arbitrary division made merely as a matter of convenience. Roughly speaking, the primary force may be said to be due solely to the motion that the reciprocating mass derives from the rotation of the

crank pin, while the secondary inertia force is attributable to the disturbing effect on the motion of the piston set up by the obliquity of the connecting rod.

### Calculation of Inertia Forces.

It is quite a simple matter to calculate the exact value in lbs. of the inertia forces. The values with which we are chiefly concerned are those at the top and bottom of the stroke. The formula for the primary force is

$$P = \frac{W \times R \times N^2}{36,000} \text{ (approximately)}$$

where *P* is the primary inertia force in lbs. at either end of the stroke, *W* is the weight in lbs. of the reciprocating parts (piston, gudgeon, top half of connecting rod, etc.), *R* is the crank radius in inches, and *N* is the speed of the engine in r.p.m. The secondary inertia force at either end of the stroke, which we will

denote by *S* lb., has the value  $P \times \frac{R}{L}$ , where *L* is the length of the connecting rod in inches. Further, if *P<sub>T</sub>* and *P<sub>B</sub>* represent the actual or net inertia forces at the top and bottom of the stroke respectively, then

$$P_T = P + S = P \times \left(1 + \frac{R}{L}\right)$$

and

$$P_B = P - S = P \times \left(1 - \frac{R}{L}\right)$$

(see fig. 2 (ii.)).

It is clear from these formulæ that the inertia forces are increased by increasing either *W*, *R*, or *N*; this is in perfect agreement with the results of experience, for it is common knowledge that the inertia forces, as measured by the resulting vibration set up, are intensified by increasing the weight of the piston, the stroke of the engine, or the speed.

(To be continued.)

### A FINE PERFORMANCE IN THE BIRMINGHAM M.C.C. TRIAL.

As reported in our last issue, five Indians were entered in the Midland "War Workers'" Trial, and all gained gold medals. Four of these are shown above; the fifth was a solo mount.

## OVERSEAS OPINIONS.

A Further Selection of Letters from Readers scattered all over the World.

OUR April mail bag has again brought us many welcome letters from Overseas, and a number of extracts are given hereunder. The general trend of opinion expressed is on the same lines as formerly, but a new trouble has developed. Owing, probably, to the lack of tonnage, it is natural that spare parts are not over abundant in the Dominions, and we regret to learn that in one or two cases sole agents are rather inclined to take advantage of their customers in this respect. We have heard several complaints of this recently.

On the question of roads some writers, apparently ignorant of the present condition of our English roads, have compared their roads with our billiard table-like surfaces; but we think that they have no idea what an amount of damage can be done in two years of war, with roads receiving hardly any repair beyond occasional patching, and the increased heavy traffic of war lorries, etc. We rather fancy that our correspondents would be sadly disappointed were they to see many of our fine old main roads in their present condition. However, as it has often been said, "It is an ill wind," etc., for there is little doubt that this extreme roughness of road surfaces at home will do more to direct our manufacturers' attention in the direction of spring frames than any number of overseas riders' complaints. The result, of course, will be that the latter will eventually reap the benefit and get their pet British mount complete with a spring frame.

A Punjab reader, overwhelmed in enthusiasm for his sidecar, would take us to task for devoting so much attention to the baby two-stroke, to the very name of which he takes exception. He says: "Why boost noisy babies, when such magnificent machines as the 6 h.p. A.J.S. outfit and others, such as Clyno, Sunbeam, and P. and M., are on the market?" Our correspondent evidently forgets that sidecar outfits, especially those which he mentions, are not new ventures, but soundly established vehicles improved by continual trials and Piess attention in their early days—though there is still much to be done—whilst the little cheap two-stroke is quite in its infancy and requires more encouragement than an established type of machine. Incidentally, the future prospects of the two-stroke for economical motoring are undoubtedly very great.

### WHAT OUR READERS SAY.

MR. T. G. WATSON, Dudley, New South Wales: "My engine runs fairly cool as long as the temperature keeps within reasonable limits, say 75° to 85°, but a hot westerly in the bush fire season sends it up to anything from 105° to 115° in the shade. It is then that I feel the need of

something more than the usual radiating fins as designed by the makers to keep the engine below a cherry heat. On the last occasion when we had a turn of those conditions here I had a long grind uphill on a 'bush track' road! Most of it was low gear work, and I just managed to keep my poor little engine going by douching it frequently with cold tea (part of my luncheon outfit). Possibly Harcourt radiators might effect an economy of the tea—in such weather one wants the tea bottle to keep one's own works cool. A number of American firms are opening depots out here, and I know of one for a fact which is looking for premises in Newcastle. A depot in Newcastle will tap a populous wealthy, and growing district. The workers in the coalfields here earn good money, and spend freely. Motor cycling is popular amongst them, and they like the best of everything. There is already a big market, and it is going to be bigger. I predict that the Yankees are going to collar the lion's share of that market."

### Mudguard Clearance.

"P.Y.C." New South Wales: "I think mudguards could be greatly improved for machines intended for use out here. They should be flat, or, if rounded, be much larger and without side wings, on account of continually clogging up. When one rides on wet muddy roads which have not been metalled great trouble is experienced. I have frequently seen riders after riding five or six miles get off and scrape mud from between guards and wheels, and frequently having to remove the front guard to get along at all."

### British Finish v. American Cheapness.

J.L.W., Sec.-Lt., 2nd A.D.B.D., British Expeditionary Force, France: "There are some fine roads about here, better than in New South Wales, but that is about the only thing in which you beat us. Your climate, whilst being very nice for people who can go indoors to a warm room when they want to, is no good for constant outdoor tent living. We have to shiver to get warm, especially after coming from Egypt. I am an engineer, and as such appreciate the better finish and higher class work of the British article, but at the same time I would remind you that the average rider is a person to whom the above-mentioned things matter nothing, compared with ease and low price. The last mentioned, when pushed by a go-ahead people, result in the state of things existing in Australia, where the Americans are rapidly capturing the market. I cannot understand why some well-known machines still have their magnetos so close to the ground in front of the engine when there is plenty of spare room behind the cylinder. The persistency with which some firms hang on to the old system of front fork springing has been a source of wonder to me. They evidently fail to realise that our best roads are only equal to their worst."

### Insufficient Ground Clearance.

MR. P. Y. CUDBIRD, Lismore, N.S.W.: "Our roads out here are simply shocking, and the people seem to have no idea whatever of what a road should be. I only wish they would take a trip to England then they might know what a road should be like. On the last trip I made I came across four or five miles of loose metal lumps as large as one's head, and was several times nearly thrown over."

"If only manufacturers would fit spring frames to Overseas models it might make riding much more pleasurable."

### Overseas Opinions.—

Another thing that is wanted is greater clearance between the crank case and the road. A friend of mine was out recently, and when travelling at about 15 m.p.h. over a railway crossing the crank case struck the rails, which were raised about 2½ in. above the ground. It made a hole in the crank case, and he had to push the machine a distance of two miles—an unpleasant job with a temperature of 90° in the shade."

### Sole Agencies.

"J.H.R." Nongoma, Zululand, South Africa: "I was interested in a letter from Mr. E. Clarke, of Christchurch, N.Z., containing the following illuminating and apparently heartfelt remark: 'As far as New Zealand is concerned sole agencies are a curse to motorists.' My experience of a sole agency in this country prompts the wish that Mr. Clarke had omitted the qualification 'as far as New Zealand is concerned.' That British manufacturers should so very, very slowly adopt suggestions made for the comfort of Overseas riders raises a feeling of exasperation which is only modified by a confidence in the intrinsic soundness both of quality and design of British productions. Against this the American machines give us in design at least that for which we ask—heavy rims, spring frame, good ground clearance, 3 in. tyres, and low riding position. Over and above all this comes the matter of the sole agency, which is used by the agents, who would say, 'Deal with us or nowhere, for we control the spares.' What, then, is a patriotic motor cyclist to do?"

coming up to the starting point each time, looked like fast motor boats or destroyers at full steam. You could see just the top of the rider, and on either side was a stream of white dust about 2ft. high. Of course, there are numerous accidents."

### Difficult Travelling in Sand.

MR. J. E. ENGBLEY, Broken Hill, New South Wales: "I ride a 7 h.p. Indian two-speed, and have done several long trips inland with sidecar attached. Deep sand has been my chief trouble on these trips. I recently made a trip of 650 miles over extremely bad country. The sand was so deep at times that the footboards would be buried in it, of course bringing us to a standstill. Apart from the sand, we had no other trouble. This trip, which occupied four days, was made in the middle of summer, and the day we started the temperature was 110° in the shade."

### WITH A MOTOR CYCLE IN THE CAPE PENINSULA.

Filling up with petrol at Howe Hoek—a typical country post office. A sidecar outing by a party of Cape Town motor cyclists.

### Mudguards and Hot Engines.

MR. R. G. SULLIVAN, Inverell, N.S. Wales: "Mudguard clearance gives considerable trouble here in bad weather. If we have any rain it is almost impossible to get along on our average roads. I have often had to leave my cycle on the road and walk to my destination, being unable to get along on account of the wheels becoming jammed with mud; for this reason many riders remove their guards altogether. There is nothing on earth that sticks firmer than Australian black mud. In summer we sometimes have difficulty in keeping our engines reasonably cool. In

Warialda district the thermometer registers anything from 100° to 115° F. during summer. If the machine is stood in the sun for about half an hour it will be so hot that it is distinctly uncomfortable to place one's hand on it. There are some parts of Australia where it is even hotter than here, and you can well imagine that it is difficult to keep the engine running cool under these conditions."

### 5 to 6 in. Ground Clearance Ample in N.Z.

MR. A. W. EVERETT, Canterbury, N.Z.: "I consider five to six inches ample ground clearance, for if the weight is too high off the ground it is a little dangerous in heavy side winds. It blows very violently about the gorges out here at times."

Oude Kraal, a Cape Town motorists' paradise.

### Strenuous Races.

MR. P. GORDON CONIG, Katoomba, N.S.W.: "We are always interested in accounts of trials at home, and, although ours are on a very much smaller scale, our conditions, as far as we can make out, are even more strenuous. For instance, last year during June we had a 100 miles race, the Grand Prix. On the trip there we had to drive through snow some inches thick, and you can imagine our roads, which never have any metal on and are as slippery as glass. The Course D Circuit, held in January, was run over a three and a half miles circuit, the course being the same distance as the Grand Prix. Parts of the course were 6 in. deep in dust. This dust is just like so much flour, and underneath it are ruts of all sizes and shapes. The riders,

## A MULTUM IN PARVO EASTER TOUR.

800 MILES IN FOUR DAYS, INCLUDING  
THE BIRMINGHAM M.C.C. TRIAL.

**E**IGHT hundred miles in ninety-five hours! I can well imagine one or other London-Edinburgh competition men curling their lips disdainfully and striking a feeling of pity for one who is constrained to enthuse over such an accomplishment. But let them pause, and if they care in fancy to follow our wheel tracks over our route, they will, I am confident, admit, perhaps grudgingly, that "accomplishment" is the correct word to employ. I am a London-Edinburgh merchant myself, and can, therefore, make due comparison.

It was my brother who conceived the idea of a Welsh tour at Easter, and, acting on my advice, he obtained an itinerary from the Automobile Association upon which I think it would have been impossible to have improved. My brother's mount was a 1916 Sunbeam combination with M.A.G. engine; mine a 1914 Enfield combination with nearly 13,000 miles to its credit; and our wives were our passengers.

Our programme was rather ambitious, embracing some of the most difficult Welsh coast roads, the very severe yet extremely sporting trial course of the Birmingham Motor Cycle Club, and the return journey to London by Tuesday morning.

The weather, as all will recollect, had been atrocious for quite a considerable period before the holidays, and continued so right up to the Thursday, but Good Friday morning broke fine and sunny, much to our satisfaction and still greater to our surprise. We made our departure from Hendon at 7 a.m., bound for Aberystwyth, *via* Oxford, Worcester, Leominster, Rhayader, but unfortunately were baffled in our desire to reach Aberystwyth that night by tyre trouble with

which my brother met and by our missing the route. However, we reached Rhayader, and there put up for the night after a mileage of 210.

### The Beauty of the Devil's Bridge.

We got on the road again on Saturday morning about ten o'clock with the intention of having lunch at Aberystwyth. But again our plans were frustrated, though not this time by trouble but by pleasure. Any reader who has travelled along this road will anticipate my meaning. I refer to Devil's Bridge and all its surrounding and almost intoxicating beauties. Devil's Bridge is itself an antiquity. It consists of three bridges, not side by side or in line, but one superimposed above the other. Leaving Devil's Bridge on the way to Aberystwyth, one obtains splendid panoramas of the surrounding country, snow-capped Snowdon being plainly visible on the right at a distance, I should think, of forty or fifty miles.

Aberystwyth, where is situated the University College of Wales, a magnificent edifice, provided us with an exceedingly pleasant impression. Earlier in my remarks I mentioned our desire to reach Aberystwyth for lunch. As a matter of fact, it was nearly 4 p.m. when we arrived, having spent so much time in admiring the scenery and sights one met with after Rhayader. After tea we turned our wheels in the direction of Dolgelly *via* the roundabout coast road, with a view of staying the night. The first town we passed on the way was Machynlleth. Thence we proceeded by Aberdovey to Dolgelly, which town we consider has a right to fame by reason of its numbers of small boys and dogs, with which the place seemed to swarm.

### A Multum-in-Parvo Easter Tour.

It was our intention on the next day (Sunday) to get to Birmingham that night in time for the competition on the following morning.

#### Round the Welsh Coast.

We left Dolgelly at 6.45 a.m., reached Barmouth, which we thought an exceedingly pretty town, then proceeded through Harlech, Penrhyn, Portmadoc, and Tremadoc, passing quite close to Criccieth. After Tremadoc we drove along the Pass of Aberglaslyn, the mountain and river scenery there being magnificent. A little further we passed through Llanberis, by the foot of Snowdon, but, unfortunately, the peak was obscured by cloud. We did not, therefore, obtain anything like the magnificent view we had

of the mountain from Aberystwyth. Continuing, we reached Carnarvon early. Thence we passed on by the Menai Bridge to Bangor. The Anglesey country appeared very fine from the extensive view we had of it from the Welsh coast road. From Bangor we turned south, bound for Birmingham, via Bettws-y-Coed, Llangollen, etc. Unfortunately, time did not permit of any leisure in viewing the sights of the two towns last mentioned, but the country in the vicinity was suggestive of many hidden beauties.

#### A Notorious Piece of Road.

Near Corwen we unfortunately struck a piece of road about ten miles in length the surface of which baffles description. I trust that by the next time I may be in that district and likely to employ the same road the local surveyor will have had occasion to travel over it at speed on a solid tyre push cycle propelled by an Auto-wheel. I think that things round there would then "move some." After Llangollen the road surface improved until it became of a billiard-table-like character, and for mile after mile we were able to enjoy the pleasure of averaging 30 m.p.h. This joy, however, was somewhat adulterated by the nightmare of a ride we had in the dark between Wolverhampton and Birmingham with regulation discs in our lamps.

### Impressions of the Birmingham Trial.

The following morning we were up betimes making several precautionary adjustments to our mounts preparatory to the start of the Birmingham Trial at nine o'clock, as although we had been fortunate in experiencing an almost trouble-free journey right through to Birmingham, we anticipated a stiff course, and did not wish to leave anything to chance. However, "Man proposes —," as, although I made a clean sheet during the morning part of the trial, I unfortunately petered out on Sudeley Hill when going well at 20 m.p.h., due to my carburetter entirely drying up. It speaks well for my machine when I say that on all the single-figure observed gradients my speed never dropped below 20 m.p.h., more especially when one considers the mileage previously covered. A

most curious coincidence was provided by the behaviour of my brother's machine on Sudeley Hill, which suffered from exactly the same trouble as mine, but my brother cleverly saved the situation by bending down and flooding his carburetter, thus enabling the machine to get going again before actually stopping.

The trial was run over an extremely sporting course, and, although feeling very tired, we enjoyed it thoroughly; in fact, more than

any competition in which we had previously taken part. We arrived back at Birmingham itself about eight o'clock, had some tea and a rest, and left at about 11 p.m. to travel home overnight, as my brother had to be back in town on the Tuesday morning.

Eight miles before reaching Blechley we picked up a soldier tramping to that station on his way back to the Front on the following Wednesday. We apologised to him for his rough seat on the back, but he said that it was an armchair compared to some of the seats he had experienced during his twelve months in France. Thereafter our journey proved uneventful, and we arrived back at Hendon about 6 a.m., after an almost continuous mileage of 280.

I will conclude the remarks by adding we had breakfast and a bath, went to bed about 10 a.m., had some lunch at midday, and went to sleep again and did not awake until five o'clock on Wednesday morning, making total of eighteen hours' sleep.

TOM COATES.

R. S. Coates (8 h.p. Sunbeam sidecar) climbing the Old Wyche in the Birmingham M.C.C. trial. Mr. Coates is the brother of the writer of the accompanying article. Both included the trial in the itinerary of a holiday tour. Note touring equipment and two spare tins of petrol on carrier.

**AN IMPROMPTU  
HILL-CLIMB HELD BY  
OFFICERS OF THE ROYAL  
FLYING CORPS.**

(Above) A driver of a Triumph sc., who made a good ascent.

(Below) To get down the hill is sometimes more difficult than getting up. Several human brakes were required in this instance.

THE SCENE WAS ALMS HILL, NEAR HENLEY-ON-THAMES, WHICH WAS IN EXCELLENT CONDITION, THANKS TO THE DRY WEATHER, AND THE DATE, SATURDAY LAST.

(Above) Sec.-Lt. Milne (5 h.p. Indian) nearing the top. His time was 54½s., third fastest.

(Centre) Capt. Scott, who made fastest time—50½s.—on his Norton.

(Below) With a passenger on the carrier. The machine is a Harley-Davidson, and the rider Lt. de Courcy.

**TIME TO LIGHT LAMPS.**

GREENWICH TIME.

May	4th	...	...	7.55 p.m.
"	6th	...	...	7.58 "
"	8th	...	...	8.0 "
"	10th	...	...	8.3 "

**Recognition for Volunteers.**

Volunteers have recently been given military status by the War Office, and it is now unnecessary to wear the red "G.R." armlet on their green-grey uniform. The officers are, it is stated, to have commissions.

**Control of Petrol.**

The committee appointed by the Board of Trade to control the supply and distribution of petrol—the formation of which was announced in the daily press a few days ago—has issued an appeal to all users to restrict consumption as far as possible.

The members of the committee are Mr. Oliver Bury (chairman), Mr. A. E. Bowen, Sir John Hewett, Mr. Philip G. L. Webb, and Mr. H. W. Cole of the Board of Trade (secretary). The offices of the committee are at 29, Abingdon Street, Westminster, S.W.

A J Dowler ( $3\frac{1}{2}$  h.p. Sunbeam), a gold medal winner in the Birmingham M.C.C. trial reported in our last issue.

**The Institution of Automobile Engineers.**

The next meeting of the Institution of Automobile Engineers will be held in the Hall of the Royal Society of Arts, John Street, Adelphi, W.C., on May 10th, at 8 p.m., when Mr. L. H. Pomeroy, Wh.Ex., will read a paper entitled "The E.S.C. Standard Steel Specifications."

**Plain Bearings for Steering Heads.**

A. B. Wade, in writing from France, where he is serving with the M.M.G.S., refers to the subject of stands for sidecar outfits, which we discussed some little time ago. He tells us that the fact of a heavy outfit being jacked on to a stand, which, owing to its construction, can only stand on one leg, is the cause of a large portion of the repairs. Another point he brings up is the fact that ball bearings in the steering head give a very great deal of trouble, and he is of opinion that a well-made plain bearing would overcome the difficulty. We are personally inclined to think the plain bearings would give considerably more trouble than the ball bearing type. Other opinions on this subject would be interesting.

**Trials Wanted.**

When things are normal again, and trials "to improve the breed" are run once more, there are two points in the modern machine which require to be developed. One of these is cleanliness—that is, cleanliness of a nature which this war is not tending to bring about. Note this suggestion, ye trials organisers! Start your competitors on new motor bicycles, and clothed in new and spotless overalls, on a hundred miles run over any sort of roads, and then dock them a mark for every spot or part of a spot to be found on these once unsullied garments. Mud spots to be ignored, oil spots to count.

**Flexibility.**

Here is another idea. Start the competitors on track or road—it does not matter which—and make them run as slowly as possible upon top gear. Then take off marks from every machine which misses fire. Next take the motor cycles which have passed this test, make them go through it again, and then at a certain spot where there are observers make the drivers suddenly accelerate. We wonder how many motor cycle engines, four-stroke or two-stroke, would go through this ordeal without losing marks for misfiring.

**SPECIAL FEATURES.**

A NOVEL ENGINE (illustrated).  
A MULTUM-IN-PARVO TOUR.  
IMPROMPTU HILL-CLIMB BY  
R.F.C. OFFICERS.

**Canadian Military Relay Run.**

The Canada Motor Cyclists' Association are organising a relay run of 300 miles from Ottawa, the home of the Canadian army headquarters, to Niagara-on-the-Lake, where there is a big camp. The run will take place in June, and it is expected that about forty riders will be required.

**Mudguarding.**

There is one thing that the great trial now going on "over there" is developing, and that is protection against mud. Let those makers who are not among the chosen few note the developments in this direction, and also the improvements in frames and spring forks. What we want is an unbiased report for the benefit of the trade in general, and not the accumulation of data for the benefit of only two or three makers.

HOLDERS OF THE WATCH.  
Messrs. Alec Ross and Olai, starters in last week's Birmingham M.C.C. trial

**Have you seen him?**

An advertisement in the daily papers offers £20 reward for identification and detention of a soldier, age nineteen, looks older, 5ft. 9½in., 41in. chest, blue eyes, strongly built, who may probably enlist for immediate service abroad, "preferably Motor Machine Gun Section."

**Police Traps.**

The Metropolitan police are, as usual, very active. There are two traps on the main London-Staines-Exeter road, one from Youngs Corner and the other from Gunnersbury Station to Gunnersbury Lane. We are informed that the policemen boast of the number of convictions they make. The police traps certainly did not prevent a nasty accident last Sunday morning, when a man was run over by a steam lorry.

**Hill-climbing in South Australia.**

The South Australia (Adelaide) M.C.C. held a hill-climb at Sellicks Hill some time ago, though results have only just reached this country. Timing was over a distance of 3½ miles, and formula results were as follow:

UP TO 300 c.c.

1. J. R. Koch (2¼ Lewis)
  2. E. E. Warren (2¼ Elliott-Villiers)
- Fastest time, Koch, 7m. 20 4-5s.

300 TO 350 c.c.

1. H. J. Gard (2¼ Douglas)
  2. J. L. Koch (2¼ Lewis)
  3. E. E. Koster (2¼ N.S.U.-Kent)
- Fastest time, Gard, 6m. 45 1-5s.

PRIVATE OWNERS, UP TO 600 c.c.

1. F. R. Limb (¾ Norton)
  2. E. E. Koster (¾ Kent)
  3. W. Driver (¾ Norton)
- Fastest time, Limb, 5m. 47s.

TRADE RIDERS, UP TO 600 c.c.

1. A. B. Carnell (¾ Lewis)
  2. R. H. Abbott (¾ Kent-Jap)
  3. W. Driver (¾ Norton)
- Fastest time, W. Driver, 6m. 3 1-5s.

OVER 600 c.c.

1. N. K. Torode (7 Indian)
  2. O. E. Nalty (7 Indian)
  3. E. O. Wagener (8 Blue Spec-Jap)
- Fastest time, Torode, 5m. 41 1-5s.

SIDECARS UP TO 600 c.c.

1. W. Courtney (¾ Lewis sc.)
  2. L. S. Eglington (¾ Kent sc.)
  3. E. Warren (4 Elliott sc.)
- Fastest time, Courtney, 8m. 5 4-5s.

SIDECARS OVER 600 c.c.

1. E. Whitten (7 Excelsior sc.)
  2. E. Ferguson (7 Indian sc.)
- Fastest time, Warren, 7m. 14 2-5s.

**First News and "The Motor Cycle."**

Following upon our first exclusive descriptions with illustrations of the Birmingham and Sheffield Easter Trials (a week in advance of other journals), we give in this issue the first illustrated account of an impromptu hill-climb at Alms Hill, organised by officers of the R.F.C. stationed in the South Midlands. Among the other features of this issue is a description with drawings and photographs of an engine of strikingly novel design, whilst Overseas motor cyclists will find much to interest them.

**Taxation and Economy.**

A reader informs us that in consequence of the large increase in motor cycle taxation he has decided to resign his membership of the Automobile Association and Motor Union.

**The National War Funds.**

At the week-end the principal relief funds stood as follow:

The Prince of Wales's National Relief Fund (£5,153,000 distributed)	£5,885,817	0	0
The Queen's Work for Women Fund	169,324	8	10
Fund for the Sick and Wounded	3,687,289	0	0
Tobacco Fund	105,335	0	0
Polish Victims' Relief Fund	125,323	12	10

**Birmingham Trial Results.**

The illustrated report of the Birmingham M.C.C. Easter Monday trial published in our last issue concluded with the provisional results. The committee has since made one or two amendments as follow:

J. E. Greenwood (4 Sunbeam) awarded gold medal.

A. Birch (2¾ Douglas) awarded first-class certificate.

Staff Sgt. C. B. Thomson (4 Douglas sc.) awarded first-class certificate.

T. Sinister (4 B.S.A. sc.) awarded first-class certificate.

B. W. Harcourt (8 Rex-Jap) awarded second-class certificate.

Miss Hough (8 Morgan) awarded second-class certificate.

P. G. Tomkins (2¾ Douglas) awarded second-class certificate.

A. E. Kibble (4 Triumph) disqualified for leaving course.

**Present and Future Condition of our Roads.**

Colonel R. E. Crompton at the meeting of the Roads Improvement Association last week said the roads throughout the country had deteriorated to a serious extent, and no extensive improvement could be expected at present.

It was unfortunate that the Government found it necessary to appropriate the Road Board's income for war purposes, and it must have the effect of adding to the work to be done by the association hereafter. The Roads Improvement Association had urged that the fullest advantage should be taken of the existing funds to keep the roads in as good a state as possible.

**The Clearing House.**

There are still six members who have not received parcels resulting from the Birmingham district motor cyclists' patriotic concert. The names are:

- T. W. Bladder, joined 10th Warwicks.  
R. B. Ewens.  
E. A. Eastwood, of Derby.  
B. L. Patterson-Tylden, of Derby.  
H. A. Pattman, Lt., Birmingham Battalion of Warwicks.

G. H. Stocking, joined A.S.C., M.T.

Should this paragraph meet the eye of any of these, they should write to Mr. S. Kempson Jones, 93, John Bright Street, Birmingham. Information is also desired concerning whereabouts of relatives of Sgt. T. Hubbard, a member of the North Birmingham Club, who joined the R.E., and was subsequently killed in France.

**A Curious Accident.**

An accident occurred during holiday week near London, due to a party of beanfeasters on a waggon being pulled up in the centre of the road by the police for driving without lights. Almost immediately after, a motor cyclist proceeding with the usual greatly reduced lights collided with the back of the waggon, causing serious damage to both himself and his machine.

**A SIDECAR OUTING FOR WOUNDED SOLDIERS.**

Taking advantage of the summer-like weather, some members of the Doncaster M.C.C. take a few convalescent soldiers for a sidecar outing. Two of the drivers, it will be noted, are ladies.

# "THE MOTOR CYCLE" RECRUITING SECTION.

## RECRUITS WANTED FOR IMMEDIATE SERVICE ONLY.

### Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

### Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

**A**S was anticipated, the calling up of the married groups between 33 to 41 (ages 27 to 35) has caused a great increase in the number of applications to join the M.M.G.S., though there never was any dearth of candidates for this section. A delay of a day or two is inevitable in dealing with the mass of correspondence, and it would relieve the pressure if motor cyclists and car drivers will note the particulars on this page, and attend one of the inspections arranged. There is no need to write at all, except in the case of men situated a long distance away. Such men who desire to join the M.M.G.S. should fill in the form provided (see page 402 of the last issue of this journal), and attach two references as to experience and ability, when, if satisfactory, a free railway warrant will be forwarded.

Only applications from men ready for immediate service can now be dealt with.

Last week in Manchester over fifty candidates presented themselves for test, and forty-seven were duly accepted. A good proportion were young men, hitherto employed in reserved occupations, and now released for service.

On Saturday last Mr. Geoffrey Smith, the editor of *The Motor Cycle*, attended at 20, Tudor Street, London, E.C., to interview applicants from London and the South, and many of these men are now in khaki at the training centre.

For the information of prospective recruits, the conditions of enlistment in the M.M.G.S. are appended.

Applicants must be experienced car drivers or motor cyclists, able to execute ordinary running repairs.

Pay, 1s. 2½d. per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limits, 19 to 40.

Applicants must be medically fit for General Service abroad or for Garrison Service abroad.

8,988 is the total number of applications from motor cyclist and car driver recruits personally dealt with by the editor of this journal since the outbreak of war.

### Next Week's Inspections.

This week's inspections were at Coventry on Tuesday and Nottingham yesterday (Wednesday).

During next week Mr. Geoffrey Smith will attend at

COVENTRY.—Recruiting Office, Masonic Buildings, 11 a.m. to 4.30 p.m., Tuesday, May 9th.

LONDON.—*The Motor Cycle* Offices, 20, Tudor Street, E.C., 1.30 p.m. to 4.30 p.m., Saturday, May 13th.

Motor cyclists and car drivers ready for immediate service can be tested at the above times and places.

Two motor cyclists from the Isle of Wight, who were due to attend an inspection of recruits in London on Saturday last, became acquainted with each other by the fact that one was reading *The Motor Cycle* whilst crossing the ferry from Cowes to Southampton. On the reader being approached, both were agreeably surprised to find that they were bound for the same destination.

### Last Week's Recruits.

A list of over a hundred recruits accepted last week is appended:

Adler, P. B., Hove.  
Ainley, O., Rotherham  
Allen, A., Gresswell.  
Allnatt, J. O., Wokingham.  
Atkin, H., Grimsby.

A GOOD LOAD FOR THE 6 h.p. SUNBEAM SIDECAR.  
Seven men of the Motor Machine Gun Section returning to camp from trench practice.

Baines, J. H., Wing.  
Barton, L., Manchester.  
Baxendale, O. O. B., Sabden.  
Bell, C., Wigan.  
Blankens, E. J., London.  
Boswell, G. O., Rolleston.  
Bothway, R. E., Norwich.  
Boutel, M., Bushey.  
Bowker, J. J., Tattenhall.  
Braid, A., Abergelle.  
Bramble, R. J., Winchester.  
Briggs, N., Bradford.  
Brooks, W., Sale.  
Bullock, H., Eastleigh.  
Bye, F., Winchester.  
Carruthers, R. G., Edinburgh.  
Chandler, W. P., Brixton.  
Chapman, H., Lincoln.  
Clement, O. H., Bognor.  
Cockton, J. B., Cockermouth.  
Dark, E., Preston.  
Davidson, A., Glasgow.  
Dimond, W. A., Didsbury.  
East, M., Coraard.  
Flint, P. A., Eastbourne.  
Giddins, W. V., Crowland.  
Goldie-Taubman, P., Brighton.  
Gooch, L. J., Brondesbury.  
Groves, H. G., Witney.  
Gwyther, R. P., Herne Bay.  
Haggerth, L., Colne.  
Halford, F., Idle.  
Harmer, C. W., Ticehurst.  
Hedges, A. J., Weymouth.  
Hix, J. G., Holbeach.  
Hobbs, H. J., Earl's Court.  
Hodgson, W. J., Westcliff-on-Sea.  
Holden, J. W., Cobham.  
Howard, G., Clitheroe.  
Jacques, W., Cirencester.  
James, F. C., Northampton.  
Jennings, G., Shipley.  
Jones, G. P., Lertonstone.  
Kilminster, W., Walthamstow.  
Knight, C. R., Wembley.  
Lawrence, C., Cowes, I.O.W.  
Lee, J., Nelson.  
Leone, W. C., Brixton.  
Loch, W. H., Dawlish.  
Long, E., Grange-over-Sands.  
Lori, R., Colne.  
Mackenzie, J., Liverpool.  
Mann, G., Avoch, N.B.  
Mansfield, H. J., Upper Clapton.  
Marshall, A. C., Epsom.  
Merry, F., Bolton.  
Morgan, E., Norwich.  
Nadin, J., Nelson.  
Needham, G., Holbeach.  
Newell, J. H., Bradford.  
Nicholls, J., Nantwich.  
Norris, G. A., Muswell Hill.  
Norfold, W., Brighton.  
Petrie, J., Kirkcaldy.  
Pier, A. G., Bexton.  
Pinnock, R. E., Hammersmith.  
Priscott, R. H., Hurstpierpoint.  
Pryce, H. C., King's Langley.  
Pugh, W. D., Ealing.  
Purkis, G. A., Newport, I.O.W.  
Reeks, S. T. O., Bournemouth.  
Richmond, H., Manchester.  
Ritchie, A., Norland.  
Rivers, F. G., South Farnborough.  
Robinson, A. E., Gainsborough.  
Roney, J. B., Barrow-in-Furness.  
Rosenberg, D., Stepney.  
Routledge, H., Carlisle.  
Rovston, E. R., Little Evesden.  
Scott, W., Horsham.  
Selfe, R. W. C., Stratham.  
Sherwood, H., Winchester.  
Shuttleworth, W., Chorlton-cum-Hardy.  
Sladden, F. M., Brighouse.  
Springham, P., Lindfield.  
Stinnett, G. H., Spalding.  
Strauss, S. G., Salford.  
Sugden, L., Wokingham.  
Sutherland, J. W., Wealdstone.  
Swales, J., Market Weighton.  
Thornton, J., Preston (Hull).  
Thornycroft, E. F., Nantwich.  
Toombs, V., Mildenhall.  
Trought, H., Grimsby.  
Unsworth, G. G., Altrincham.  
Wadsworth, C., Sowerby Bridge.  
Walmsley, J., Darwen.  
Walton, E., Southport.  
Westmacott, J., Dorchester.  
Whalley, R., Walkden.  
White, L. R., Folkestone.  
Williams, F. C., Alton.  
Wright, E. G., Paddington.

## Overseas Notes and News.

### ACTIVITY OF THE CANADA M.C. ASSOCIATION.

AT present nobody under the age of eighteen may ride a motor cycle in Canada. The Canada Motor Cyclists' Association has appealed to the Ontario Government for the reduction of the age limit from eighteen to sixteen years for riders of lightweights and bicycles with motor attachments. The result of this appeal will be looked forward to with interest, especially the definition of a lightweight, if the suggestion is adopted.

With a view to encouraging American motor cyclists touring in Canada, the C.M.A. expects to secure a concession from the Federal authorities in the way of a ten days' free privilege for motor cyclist tourists entering the country. This concession will enable American riders to tour in the Dominion for ten days without the necessity of paying a deposit or making a bond to cover duty charges at time of entry.

### RACING ON LAKE PERKOLILLI.

A RACE meeting of the Goldfields (Western Australia) Motor Club on March 19th was spoiled by a heavy downpour of rain. The scene of the racing was the bed of Lake Perkollili, and the heavy downpour only permitted of part of the programme being run. Results of those events which were run are:

#### 4 MILES OPEN HANDICAP.

1. J. Elsbury (Sunbeam).
2. Len Hope (Sunbeam).
3. A. E. Pike (Triumph).

Winner's time, 4m. 30½s.

#### 6 MILES GOLDFIELDS CHAMPIONSHIP.

1. J. Elsbury (Triumph).
2. Len Hope (Sunbeam).
3. Roy Wigmore (Triumph).

Winner's time, 6m. 45s.

#### 4 MILES CLASSICO.

1. Len Hope (Sunbeam).
2. A. McDonald (B.S.A.).
3. Roy Wigmore (Triumph).

Winner's time, 4m. 43½s.

### U.S.A. MILITARY AUTHORITIES AND THE MOTOR CYCLE.

OUR American contemporaries are evincing great interest in the part that motor cycles are playing in the punitive expedition against the Mexican, Villa. It is considered that the Mexican scrap is a test for the military motor cycle—though one would have thought that the latter has been proved in the great war—and upon its success or otherwise depends its adoption in numbers by the whole army of the United States.

At present there appear to be between 90 and 120 machines in use, and, according to *Motor Cycling and Bicycling*, they are numerous in proportion to the size of the army on Villa's trail. According to the same paper Brig.-Gen. Bell has made certain recommendations regarding the use of motor cycles to the U.S. War Department, based upon his observations of the machines at present in use. These recommendations are that every infantry regiment should be equipped with four motor cyclists, and every cavalry regiment with at least six motor cyclists.

There are at present thirty infantry regiments, whose equipment would require 120, and fifteen cavalry regiments which would require 90 machines. "The grand total," as our Chicago contemporary puts it, of 210 does not sound very impressive, judging by British numbers, but, of course, with an increase of the U.S.A. army—which may be expected at any moment—the number of motor cycles would be correspondingly increased.

It is stated that among the fleet at present in use in Mexico are five Cygnet rear cars. These are trailers which can be adapted to fit any motor bicycle.

### TRACK RACING IN ITALY.

THE name of Miro Maffei is becoming familiar to British motor cyclists as that of a particularly fine Italian rider. The name generally appears in the honours list of any race meeting held in Italy. Miro Maffei's latest achievement was at the Milan track, on Sun-

Miro Maffei (Stucchi-Precision), a well-known Italian racing motor cyclist.

day, 16th ult., when he won a match against Merlo, whose mount was a Frera machine with S.I.A.M.T. engine. Great interest was added to the event by reason of the fact that, a week before, the same riders raced and the positions were reversed. Maffei rode a Precision-engined Stucchi.

### THE LAUNCESTON-HOBART RECORD.

THE 122 miles separating the two chief towns of Tasmania have during the past few months held a peculiar fascination for record-breaking motor cyclists. On page 403 of our last issue we referred to the time of 2h. 34m. 50s. made by E. Bayles, but, according to the March number of *Melbourne Motor Cycling*, this has been lowered to 2h. 33m. 0½s. by W. H. King, who rode an Indian.

### Average Prices

OF

### Second-hand Machines.

From "The Motor Cycle" of April 27th.

Make.	Year.	H.P.	Average for last week.	Latest weekly average obtainable

# MOTOR CYCLE TAXATION.

A commendably clear Statement submitted to the Treasury by the A.C.U.

**W**E must congratulate Mr. T. W. Loughborough, the secretary of the A.C.U., on the well-reasoned and complete statement which that body has laid before the Treasury, and a copy of which is in our possession.

It is assumed by the A.C.U. that the main object of gradation is increase of revenue. Any method adopted should, therefore, be based on:

The ability to pay on the part of the owners of motor cycles.

It is understood that there are three other main considerations:

1. The restriction of motoring for pleasure.
2. Correlation with the taxes imposed on motor cars.
3. The amount of damage caused to road surfaces.

Further, that any method adopted should be simple to understand, thus resulting in ease of collection, whilst the importance of not handicapping the industry should not be overlooked.

It is contended that the use of the Treasury Rating fails to attain any of these objects but the restriction of motoring for pleasure, and the A.C.U. is prepared to produce evidence that this hardly exists at the present time. On the other points the Treasury Rating is found wanting because it is not a true measure of horse-power; it has no relation to the purchase price of either new or second-hand machines; it is inapplicable for technical reasons, and gives a very unfair comparison of horse-power between cars and motor cycles; it would force manufacturers to adopt one type of engine, the long stroke single-cylinder (and although this type is excellent it is not desirable that it should be developed to the exclusion of other

equally meritorious designs); and lastly it would make collection difficult, as motor cyclists do not understand the rating. In the Government proposals the classes are too few, and consequently the steps are too steep, e.g., a twin-cylinder of 72 mm. bore would be taxed at £3 3s., while an extra millimetre on the bore (although the stroke may be shorter and the real horse-power less) raises the tax to £4 14s. 6d.

It is, therefore, proposed that the tax shall be graduated on the cubic capacity (or, more correctly, the volume swept out by the piston) at the rate of 10s. 6d. per 125 c.c., the lowest tax being £1 1s. for 250 c.c. and under. This is substantially the same as the suggestion already put forward in *The Motor Cycle*.

## The A.C.U. Scheme in a Nutshell.

### EXAMPLES OF WELL-KNOWN MAKES.

Cubical Capacity.	Name.	Average Price.	Max. H.P. at 14.5 p.m. per 125 c.c.	Tax.
Not exceeding 250 c.c.	O.K. Junior, Auto-wheel, Calthorpe, Dayton, Levis	£25	2	£1 1 0
Exceeding 250 c.c., not exceeding 375 c.c.	Clyno, Levis, Royal Ruby, Douglas	£39	3	£1 11 6
Exceeding 375 c.c., not exceeding 500 c.c.	B.S.A., Humber, Norton, P. & M., Singer, Enfield	£57	4	£2 2 0
Exceeding 500 c.c., not exceeding 625 c.c.	Scott, Bradbury sc., B.S.A., James, Triumph, A.J.S.	£64	5	£2 12 6
Exceeding 625 c.c., not exceeding 750 c.c.	Excelsior sc., Norton sc., Rudge sc., A.J.S. sc., Bat sc., Clyno sc.	£79	6	£3 3 0
Exceeding 750 c.c., not exceeding 875 c.c.	Abingdon sc., Alldays sc., Campion sc., Enfield sc., Rex sc., Sunbeam sc.	£87	7	£3 13 6
Exceeding 875 c.c.	Bat sc., Chater-Lea sc., Matchless sc., Indian sc., Dot sc., Zenith sc.	£90	8	£4 4 0

Motor cycles of over 1,000 c.c. to be taxed at the rate of 10s. 6d. for every complete 125 c.c. or part thereof.

The above scale to be applicable to motor cycles purchased after January 1st, 1911.

Reduction for old motor cycles: Motor cycles purchased before January 1st 1911, to be rated one class lower for every year or part of a year elapsed between date of purchase and January 1st, 1911. Onus of proof of date of purchase to rest on owner.

Another suggestion which has the merit of simplicity is a tax of £1 1s. per wheel, but the first proposal as set forth in the above table is preferred. Further, the A.C.U. urges the early reconsideration of all such taxes, and recommends a merely nominal tax—for statistical purposes—coupled with a tax based on the ton-mileage, e.g., a petrol or tyre tax for the purposes of revenue.

A final table shows the probable revenue which will be obtained by each method, the totals being as follow:

Government proposals (deducting 50%, the restrictive effect of such tax) ...	£229,820
Taxation by capacity (deducting 20%, the restrictive effect, and 1% rebate allowed on old machines) ...	£244,985
Taxation by wheels (deducting 25%, the restrictive effect) ...	£273,420

It is pointed out that the damage caused to the roads by the ordinary use of motor cycles is negligible, and it is urged that in no case should a tax on a motor cycle exceed the tax on a car.

L. Calvert (Westminster), winner of the unlimited class in the Public Schools championship hill-climb. There were only two starters in the class, and both were mounted on Harley-Davidsons.

# THE LEWIS ENGINE.

## A NEW DESIGN OF STRIKING ORIGINALITY.

Fig. 2.—Section of the Lewis engine, showing how the pistons are joined in pairs.

**M**OTOR cyclists have been so accustomed to engines having cranks and oscillating connecting rods with their big-end and gudgeon pin bearings that the possibility of building an engine without these adjuncts has probably not occurred to many. Such engines have, however, been designed and built (we are not alluding to turbines) in two series, viz., steam and internal combustion engines, and differ from the usual type in the important features to which we have just alluded, e.g., the place of the crank is taken by an eccentric cam, the gudgeon pin bearing is entirely absent as the double connecting rods are fixed rigidly to the pistons; and, in fact, the usual methods of converting a reciprocating to a rotary motion have been entirely superseded in a most novel and ingenious manner.

Fig. 3.—Irregular shaped cam driven by the rollers attached to the connecting rods.

be evident that both rollers could not be in contact with it during the whole period of revolution, for the diameter is the greatest chord which can be drawn in a circle; therefore, in fig. 2 the rollers A and B would touch the cam, but some play would be allowed to C and D. This would, of course, cause a knock, and so the cam is not made truly circular, but so constructed that the lines which pass through the centre of rotation (not the centre of the cam) shall all be equal in length (see fig. 3).

### Some Details of the Lewis Engine.

The engine to which we refer is known as the Lewis; this engine we recently had the pleasure of inspecting in Mr. Lewis's little workshop at Dinas, in the Rhondda Valley, and we can assert that we were much impressed by the ingenuity and originality of design. The engine we saw had two opposed cylinders, but it was so arranged that two more cylinders could be fitted at right angles. The system also admits of six or eight cylinders, but in every case the cylinders must be in pairs and set opposite to one another. The pistons are also connected together in pairs by rigid connecting rods, such as are shown in fig. 1, each connecting rod being constructed of two steel plates carrying two hardened rollers between them and having slots through which the main engine

Fig. 1.—Double connecting rod to the Lewis engine

Pistons and eccentric cam showing how the reciprocating movement drives the main shaft

shaft passes. This shaft carries on its centre a specially shaped cam mounted eccentrically which takes the place of cranks. If the cam were circular in shape it would

Fig. 4.—Diagrammatic sketch of valve mechanism.

Fig. 4.—Diagrammatic sketch of valve mechanism.

### Torque and Balance.

It will be evident that the direction of the piston thrust will always be through the centre of the engine, and that all the cylinders will be in the same vertical plane. It is also claimed that the shape of the cam gives a very even torque, and does away with the secondary forces which the angularity of the connecting rod causes to be present in the usual type of engine, and which cannot be balanced by a revolving weight on the flywheel. The balance of the four-cylinder engine should, therefore, be excellent.

The engine we saw had stationary cylinders and a rotating shaft, but it is quite possible to reverse this procedure and make the cylinders revolve. Owing to the small size of the engine, 12in. over all, there would be

## The Lewis Engine.—

The Lewis twin-cylinder engine.

no difficulty in fitting a rotary engine into a motor cycle frame, and a four-cylinder made on the four-stroke principle, having a bore of 2 in. and stroke of 1 in. (just over 200 c.c. capacity), is claimed to give 4 h.p. at 4,000 r.p.m.

The valves are operated by scroll cams (see fig. 4), which bring forward a peg once in every two revolutions of the engine; this peg lifts a tappet, which in turn raises the valve. All the exhaust valves are operated by a scroll on one side of the engine, and the inlet valves similarly worked on the other side. The flywheel is, of course, outside, and is about 6 in. in diameter. The weight of the four-cylinder engine (without magneto) is 21 lb.

**No Flywheel.**

In the rotary model this weight can be still further

reduced, as a flywheel would be quite unnecessary, for the engine itself would take its place. Another point which is worthy of mention is that the construction of the engine admits of very large bearing surfaces, which, of course, mean very satisfactory wearing qualities.

Curiously enough, the Barry engine, which many of our older readers will remember as a design of much originality, also hailed from South Wales.

**A Rotary Steam Engine.**

At Mr. Lewis's workshop we also saw a most fascinating little steam engine of the rotary type, the case in which the engine revolved taking the place of the cylinder heads, the surfaces being ground true and made steam tight by a film of oil. This engine, which measures only 6 in. x 4 in., is said to be capable of exerting 4 h.p. at 7,000 r.p.m. with a steam pressure of 150 lb. per square inch, and it is so free from vibration that it can be run at this speed attached to a small stand and simply set up on a wall without any fixings. It can be reversed in a moment by throwing over the eccentric cams with a small lever. When this is done the engine quickly comes to rest and then starts up in the reverse direction. Such an engine, combined with a suitable flash boiler and condenser, should be ideal for a steam motor cycle.

The Lewis engine dissected, showing the two pistons, eccentric cam and other, parts.

**WELL EARNED RELAXATION FOR MUNITION WORKERS AND GROUP MEN.**

A group of competitors in the Sheffield Munition Workers' Easter Monday Trial, the results of which appeared in our last issue.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address

#### Wheel-steering for Sidecars.

Sir,—Re your illustration in *The Motor Cycle* of the 20th ult., of George Brough steering a motor cycle combination from the sidecar, I should be glad if you could give me the address of any firm (if there is one) who make a speciality of fitting the above. I think it is a splendid idea, and will certainly have it fitted to my "turnout," if possible.

F.A.N.

Sir,—Will you please publish the following letter in reply to the many enquiries we have received re the sidecar steering? The conversion carried out by us is purely a freak one for the purpose of testing out experiments under adverse climatic conditions, with more comfort than would be possible if driving from the saddle. The conversion set is not on the market, and we cannot undertake to make similar alterations to readers' machines.

W. E. BROUGH AND CO.  
G.B.

#### Motor Cycle Taxation.

Sir,—I have read your interesting issue of the 13th ult., and would ask how great is the taxation of a slide valve, two-cylinder, double-acting, four-stroke engine, 52×26, of my own design now in construction, and intended to rate 4 h.p. at 4,000 r.p.m.

HUGO MOREN.

Bofors, Sweden.  
[The Treasury rating on this engine is 6.7, and consequently the tax will be £4 14s. 6d.—Ed.]

Sir,—If you can spare a little more of your valuable space upon the subject of the newly proposed taxes, I should like to state my views as to an equitable scale of charges, and they are as follow:

	£	s.	d.
Auto wheels ... ..	15	0	
Solo motor cycle up to 4 h.p. ... ..	1	5	0
Solo motor cycle over 4 h.p. up to 6 h.p. ... ..	1	10	0
Solo motor cycle over 6 h.p. up to 8 h.p. ... ..	2	0	0
Sidecars in all cases extra each ... ..	10	0	

These figures will not, of course, total up to anything like Mr. McKenna's estimate, but I make bold to say the yield in actual cash will be more than if it is attempted to collect an amount that is both unreasonable and unjust.

It will be noted that I have reduced the Auto wheel to 15s., as I consider that a great many more would be in use at the lower figure, for, as a matter of fact, 10s. 6d. (peace time) would be ample for it, and, further, I do not think my figures for motor cycles would curtail any usage from a licensing point, but the excessive price of petrol must be considered as a factor in curtailment, and am absolutely certain that the proposed new and exorbitant taxes will seriously affect new licences and revenue accordingly.

I would like to suggest that a protest meeting be held on some Saturday afternoon or Sunday morning on Wimbledon Common, or similar open space, and a resolution taken, petition signed, and duly presented to the proper authorities. Perhaps some motor cyclist *au fait* with the procedure will come forward and help; anyhow, if something is not done quickly, we as a body are going to suffer badly and to no purpose.

JOHN J. LEONARD.

Sir,—I notice in *The Motor Cycle* of the 27th ult., page 410, you say, referring to taxation, that "no recommendation was likely to be adopted which materially decreased the revenue which the Treasury expected to obtain." If the Treasury fixes an unreasonable sum, then it will not be got. The proposed tax on railway tickets was dropped like a hot potato, and several millions of revenue lost in twenty-four hours. Why did the Treasury let all this go? And why is the relatively small sum expected from motor taxation such a fixed and unalterable quantity? The fact is that if motor taxes are appreciably increased the revenue will be less. £4 14s. 6d., or anything near it, on big twins will knock out practically all of them. I do not think that a tax of anything over £2 on any machine will bring in more revenue. It may bring in less. The Chancellor will not get more than motorists can pay. The newspapers tell us to be very careful to economise on petrol. What about the thousands of gallons used by the L.G.O. Co. on pleasure trips at Easter?

A. W. BLACKMORE.

#### New Zealanders' Ideal Motor Cycle.

Sir,—Can you tell me where I can be likely to purchase a motor cycle having the under-mentioned features for use in New Zealand? There are a large number of keen motor cyclists in the N.Z. Expeditionary Force who have acquired a great amount of knowledge from their experiences of Colonial conditions, and I have in my spare time made a collection of their opinions as to the ideal machine for New Zealand and Australia, where the summer heat is great and reliability of great importance.

Engine.—5 h.p. twin, horizontal cylinders 70×90 mm., offset, say, 4in. to avoid side thrust under power stroke. Cylinders of copper alloy, with steel liner or inner wall and valve seats. Overhead valves of large diameter and lift, and large bearings in every case. Single flywheel outside crank case of exceptionally large diameter and heavy rim. (This is an important feature in the opinion of most Colonial riders.)

Automatic sump lubrication, in addition to the usual tank and pump. The machine to have a long wheelbase and rear springing. The carburettor to be fitted with hot air service.

The pistons to be made of aluminium alloy. Transmission by Coventry silent chain to large proportioned three or four-speed gear box with adjustable countershaft pulley of large size, drilled to improve belt grip for leather belts in wet weather. The clutch to be of the internal cone type faced with Raybestos.

The carrier to be extremely rigid and strong. Mudguards, to be at least 4in. wide and very strongly made. Disc wheels, 30in.×3in., with perfectly watertight hubs. Magneto of British make. Forks to be very efficient, and to absorb horizontal and vertical shocks.

Abbassia, Cairo, Egypt

L. C. GREEN.

#### Top Feed Carburetters.

Sir,—With reference to the last comment made by Messrs. Brown and Barlow, Ltd., in your issue of April 27th, they say that if the float chamber lid and the petrol union are tightened up with the same pressure there is no fear of the float chamber lid coming undone when undoing the petrol

union because of the difference in the diameter of the thread and frictional resistance. With that I do not agree. If the frictional resistance is greater on the float chamber lid than on the petrol union when unscrewing it will also be greater when screwing it on, therefore if equal pressure is used when screwing them on the frictional resistance will make no difference when unscrewing. I think two spanners should be used when disconnecting the petrol union and float chamber of a top feed carburettor.

G. WELFORD.

Sir,—In your issue of 27th April I notice a lengthy letter from Messrs. Brown and Barlow, Ltd., in which they endeavour to show clearly the several advantages (?) of "top-feed" over "bottom-feed" carburettors. Their arguments concentrate round one point, and that is the disadvantages of balance weights.

I have noted the construction of carburettors of the last two or three years in which there are no balance weights at all, and the action of the needle is merely the reverse of the present-day "top-feed" variety. Balance weights are long out of date. In face of this evidence I think the arguments set forth by Messrs. Brown and Barlow crumble down. In reality they contrast the modern "top-feed" with the "bottom-feed" of several years ago! Until more convincing arguments are put forward, I, personally, will stick to the "bottom-feed" type.

JOHN W. WALKER.

#### Road Tests of a Cheap Fuel.

Sir,—Referring to your contributor's test of my carburettor and cheap fuel, it is very gratifying to find that the mileage per gallon is better, and that the carbon deposit is less than with petrol, and practically does not exist. Apparently the only objection he found was the objectionable knocking.

I would like to say that your test, in my opinion, was the most severe one that you could possibly apply to this apparatus. To begin with, a single-cylinder  $3\frac{1}{2}$  h.p. machine, loaded up with a sidecar and 20 stone of passengers, used in the really terrible weather that was prevalent when the tests were made, would disclose the slightest defect in the system, if there were one, and the total defect disclosed was this knocking of the engine at full throttle. In cases like this it is well to fit a larger main jet, which stops the knocking to a very great extent; and in this case extra air should be used, and directly the knocking starts on a hill the air valve should be shut and the knocking will stop, as the knocking is caused by the cylinder getting the full accurate charge, and consequently a very heavy explosion in the cylinder. A  $3\frac{1}{2}$  h.p. single-cylinder machine is the worst one possible for this system. I have tested scores of machines during the last month or two, and can safely say that on a modern twin engine and small single-cylinders there is absolutely no suspicion of knocking.

I would very much like your contributor to give further experiences on a 3 h.p. Enfield which I have, and a two-stroke Calthorpe, and I will defy any rider to tell the difference under every condition of the road. Of course, I will be the first to admit that this cheap fuel is not quite as good as petrol, but the only real objection to it is the little difficulty in starting when cold; but almost any engine will start cold if petrol is squirted through the extra air valve, and by the time it is used up the cylinder will be warm enough to run on the cheap fuel.

Naturally, supposing the rider had the choice of petrol and this fuel at the same price, he would unhesitatingly choose petrol, but as petrol is now practically unobtainable, and this cheap fuel costs half the price of petrol, runs more miles to the gallon, is cleaner, and, if anything, more flexible, it seems to me there are overwhelming advantages in using it. If further tests are made on the two machines referred to, I would suggest that these machines are not overloaded but tried under ordinary riding conditions; but, of course, I would leave the matter entirely in the hands of your exceptionally capable contributor, and I think he will be able to say that both these machines can be raced at full speed with a wide open throttle without the slightest suspicion of a knock. I would also like him to try the fuel on an 8 h.p. Sunbeam and a 6 h.p. A.J.S., and I believe he would find that the knock on these machines was non-existent at any speed.

C. BINKS.

#### Four-cylinder Motor Cycles.

Sir,—After reading H. E. Thompson's very interesting letter *re* four-cylinder engines, I feel it would be a great privilege, not only to myself, but to numbers of others, if your contributor could be prevailed upon to give further details and outlines of the manner in which he has improved the F.N.

There are countless people, whom I know personally, that would prefer a four-cylinder machine if the various weaknesses of this type could be improved; but as these weaknesses obtain they are content to ride singles. Personally, the three points which require very serious attention are in the following order of importance: (1.) Mechanical inlets. (2.) Pump oiling, mechanical. (3.) Spark plugs in centre of cylinder head.

P. F. LEE.

Sir,—With reference to the letter from Mr. H. E. Thompson in your last issue, I have a 1913 5 h.p. F.N. motor cycle with central intake induction tube and two-speed gear. On the high gear at slow speeds the drive is jerky, which, I think, is due to the automatic inlet valves and the fixed magneto timing. There is also a sluggishness in picking up on slow speeds on top gear, and the clutch has sometimes to be slipped. I should be much obliged if your correspondent would explain the temporary attachment for working the inlet valves mechanically. If he could give working drawings I would esteem it a favour, as I am in a position (having a small lathe and tools) to carry out his suggestions. With the exceptions mentioned above, the working of the engine is perfect.

CHAS. H. VOWELS.

#### The Petrol Committee.

Sir,—In view of the troubled times in which we are living, and the fact that the Government seems to have an inclination to damage the motor cycle industry seriously, I am writing to know if the names of any of the gentlemen appointed on the Petrol Committee are known as being in any way connected with the industry, or whether by any other act or deed they have in the past proved themselves to be men likely to be able to deal in a fair manner, from knowledge gained, with what constitutes or does not constitute a fair proportion of petrol for the use of motor cycle and car owners.

I suggest to you that it is a matter you should interest yourselves in very keenly, since apparently whatever this Committee recommends will be carried out by one or other of the great Government Departments. Therefore, it behoves us as a body of motorists to "kick" if we find that the people appointed on this Committee are not suitable members.

Why not some one member of the "trade" on the Committee?

MANUFACTURER.

#### A Satisfactory Tour.

Sir,—I beg to thank you for the route you sent me, "High Wycombe to Torquay."

We found it excellent, with the exception of a few miles between Wilton and Shaftesbury. We did not go into Exeter, but turned left over Countess Weir Bridge, and then up over Halden and down into Kingsteignton. We came back by the coast road *via* Lyme Regis and Dorchester; the only bad bit on that road was between Reading and Basingstoke, but taken on the whole it had not nearly such a good surface as the Shaftesbury route.

A few items might interest you. We could get no petrol in Salisbury, but found plenty at Shaftesbury. There had been a shortage at Dorchester, several cars being held up on the Saturday. There was a pretty useful water-splash between Newbury and Andover, but we came through it all right. I should think at times it might be awkward.

I found the 7-9 h.p. Harley-Davidson and sidecar extremely comfortable, and *not* geared too highly, as seems to be a pretty general opinion.

H. E. JACKSON.

#### SUMMARY OF CORRESPONDENCE.

Several correspondents have taken exception to the remarks of "Anglo-Indian," and write pointing out that others might have been earning 6s. a day if they had enlisted at the commencement of hostilities. They show that the 6s. a day man is worthy of his hire, in view of his great responsibility, and the fact that he was a skilled man when he joined up. [This correspondence is now closed.—Ed.]

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Worn Pulley Flanges.

**Q.** I bought my first motor cycle new last August. After having run somewhat under 1,800 miles the pulley flanges have become badly worn. (1.) What is the probable cause of this? (2.) Is this normal, and shall I need to renew the flanges every 1,800 miles run? (3.) Should I get more than 33 m.p.g. with sidecar in hilly country? The motor cycle is  $3\frac{1}{2}$  h.p., fitted with a three-speed hub gear.—J.A.

(1.) Probably the cause is road dust and grit; or you may have allowed the belt to slip badly. (2.) Possibly they were made of too soft material; they should certainly last longer than this. (3.) Of course, you ought to get more than 33 m.p.g. with a sidecar with a  $3\frac{1}{2}$  h.p., even in hilly country. We should say the consumption should be 60 to 70 m.p.g. Try fitting a smaller jet, and make sure all adjustments, such as valve springs and tappets, are correct. The clearance between tappet and valve should not be greater than .4 mm.

## Misfiring on One Cylinder.

**Q.** I possess a 1914 Douglas, which has just been overhauled. Since it has come back it will only fire on one cylinder till a good speed is obtained, and it does this on both high and low gears. But when on the stand both cylinders fire quite regularly. Whether I advance or retard the ignition makes not the slightest difference to the engine. How many drops of oil per minute should the engine get when running at a moderate speed on flat roads?—H.B.R.

Your symptoms point rather to the fact that an air leak exists between the carburetter and one of the cylinders, the result being that unless the engine is running fast the mixture is too weak to fire properly. Look to all the induction pipe unions and bind any doubtful joints with adhesive tape. Look to all the valve tappets and make quite sure all the valves are seating properly and that the tappet clearance is not more than .4 mm. A valve sticking or tappet not allowing any clearance would easily cause the symptoms mentioned. You should also examine all the following points: See that the carbon brushes of

the magneto are in good order; and that the high-tension wires are not shorting anywhere. Try a new plug in the offending cylinder, and also examine the magneto contact breaker and see that the points are breaking correctly on both cams; the points should separate .4 mm.

## Oil Leakage.

**Q.** I have a  $3\frac{1}{2}$  h.p. single motor cycle, and the oil comes out of the main bearing somewhere behind the pulley and splashes all over the belt and that side of the machine. I have taken the engine down and examined the ball race, but cannot see anything wrong. I am sure that it is not because it is worn, because the machine has not done 4,000 miles, and it has been taken great care of. I have tried a felt washer between the crank case and the pulley, but as soon as it gets saturated the oil leaks as badly as ever. The air release hole through the crankshaft is quite clear. There are only about six or eight balls in the race, and they appear to be caged in. I have shown it to several motor engineers, and they cannot understand it at all. I use the best lubricating oil.—H.D.R.

The trouble might be cured by fitting an extra relief valve. This, as well as a felt washer should be of great assistance to you. In all probability, although the engine has only run a short distance the bearing may be damaged, and so allow an excessive amount of oil to pass. We would advise you to have the engine down and make sure the bearing is absolutely sound.

## Tappet Clearance.

**Q.** (1.) My  $3\frac{1}{2}$  h.p. 1913 motor cycle has ordinary clearance in the exhaust tappet when hot, but when cold there is no clearance at all. The machine starts all right and runs well. The clearance appears after a minute's running. I shall be glad if you can offer me some explanation. (2.) In *The Motor Cycle* of March 9th the action of a four-stroke engine is illustrated. You say that the exhaust opens  $\frac{1}{2}$  in. from the bottom and closes at the top, and you say this is 225°. I can make it only  $24+180=204^\circ$ .—R.G.H.

(1.) The reason you have clearance when the engine is hot and not when cold is

that when hot the cylinder expands and grows longer, and as the tappet keeps cooler it does not expand to the same extent, and this causes the clearance, which would be considerably greater if there were clearance before the engine became hot; this symptom is contrary to usual experience. It is usually found that the clearance becomes less when the engine is hot. (2.) The exhaust valve on most engines commences to open when the crank pin is about 45° from the bottom of the stroke, which in a normal sized engine means that the piston is roughly  $\frac{1}{2}$  in. from the bottom of its stroke. The valve remains open until the top of the exhaust stroke is reached. You will therefore see that the opening consists of one complete stroke of  $180^\circ + 45^\circ$ , which equals  $225^\circ$ .

## The Silencing Regulations.

**Q.** My machine is a  $3\frac{1}{2}$  h.p. 1912 single-cylinder, which I purchased in June, 1915. It is my first motor cycle, and I have ridden it quite regularly without any alteration to any part of the engine whatever. On Sunday, April 9th, I was stopped by a police officer, who asked why I had got a cut-out fitted. I replied that I had not to my knowledge, and I had never been stopped before or even cautioned. He then pushed his pencil into the hole in the end of the silencer, and said I had no baffle plates fitted. There are two holes in the end of the silencer, about  $1\frac{1}{2}$  in. diameter, which have always been there. I have an extension pipe fitted from the silencer, which is 2ft. long by  $1\frac{1}{2}$  in. diameter. Should these holes be filled up? I may add that there is no excessive noise when the engine is fully opened out. The officer even admitted that he would not have noticed me had not the friend he was talking to called his attention to me.—H.J.C.

Whether or not the silencer had baffle plates in, was not the business of the policeman. What you have to do is to arrange matters so that the gases exhaust into an expansion chamber before issuing into the open air. On the other hand, no matter what design of silencer is fitted, you may be summoned if the machine makes what is, in the opinion of a police officer, an excessive noise. A cut-out is illegal.

## PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

### Mysterious Pulling Up.

**?** I have a  $3\frac{1}{2}$  h.p. three-speed single, standard roadster, 1913 model, which did over 10,000 miles in 1913, since when I have had it abroad; but, owing to lack of roads, Active Service, and what not, I have not ridden more than 500 miles at the outside. In very hilly country in Ceylon, rising from sea level at Colombo to 6,000 feet at Newara Elia, the machine proved very unsatisfactory, jibbing at hills, which, though formidable enough, should have been negotiated by a three-speed, even with my weight (14 st.) After running for a short time, up a steep hill, the machine would behave as though the switch had been shut off for perhaps three seconds. (N.B.—I have no switch fitted.) Of course, by this time all momentum, or at any rate most, was lost, and I had to start again. It started easily and well, as though it had never had a trouble in its life; but, sooner or later, the same thing happened, generally at the next steep hill, but sometimes on the (comparative) flat. Always the same thing occurred. I tried the following: (a.) Tested the ignition, and found it correct, good fat spark, etc., but, nevertheless, tried several new plugs. (b.) Tested tank for grit, carburetter for grit, took out and cleaned everything connected with the petrol supply, dried out the tank in the hot sun, and made quite certain that there was no water in the petrol. Also saw that the union at each end of the petrol feed pipe was correctly fitted, and square, and satisfied myself that there was no leakage. Also tested needle valve, float, and everything connected with the carburetter, and found all correct; also fitted a filter which was not required. (c.) Tested compression, and found it good; valves not pitted; springs normal. (d.) Satisfied myself that the valves were not sticking in the guides, that the valves were functioning properly, that the exhaust was clear and not choked up, and the silencer clean. (e.) Tested the mechanical parts of the engine, flywheels for truth, and bearings correct (the machine had a thorough good overhaul, bearings renewed, etc., at the end of 1913). (f.) Tried larger and smaller jets, but got no appreciable difference in results. (g.) Tried over-oiling and under-oiling; nothing gained except the usual dirty engine in the former case; but anyway, was convinced that there was no sort of seizure, the stop being as gradual as the gradient would allow. On leaving the hilly country the symptoms disappeared, but as there was no hill down at Colombo this was no proof, and did not satisfy me.—H.L.C.M.

As you have apparently attended to practically everything that can be done it does not leave us many items to suggest. Your description of the trouble rather points to misfiring or pre-ignition, but why the former should only occur in the hilly districts is puzzling and difficult to solve without seeing the machine. If the plug, high-tension wire, carbon brush, and holder are in sound condition, the fault may be in the contact breaker. Make sure the fibre bush in which the

contact breaker rocker works is not swollen and causing the rocker arm to stick. Pre-ignition sometimes causes similar trouble to that which you describe, and might be due to either a faulty plug or a dirty engine. Choose a single point plug with substantial electrode, and of good make. If you take your cylinder off again make quite certain that the piston and connecting rod are quite true with the cylinder, and not leaning very slightly over to one side.

### Failure to Take Advance.

**?** I have a  $2\frac{1}{2}$  h.p. two-stroke motor cycle fitted with variable ignition. When I bought the machine it would always start and run on full advance. After a time it started misfiring, and would not take any air. I took everything down and cleaned the engine out, and took up the slack in the magneto chain. I find now that it refuses either to start or run at full advance. I have to retard the spark about one-sixth of an inch. It starts very easily and runs well, but as soon as I advance beyond this the firing stops immediately. I have spent hours trying to remedy this, but all to no avail. The make and break seems to be perfect, and yet it seems to me to be where the fault lies.—A.A.

You had better re-check the timing, which, in the case of a two-stroke, should be as follows: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just broken and the ignition lever fully retarded. Possibly, by some means or other, you have upset the timing. Make quite certain that when the ignition lever is fully advanced the contact points still break properly, and that when in this position there is nothing that will foul the switch terminal and so cause a

short circuit. If all these points are checked and found correct there is no reason why the machine should not run with ignition fully advanced.

### RECOMMENDED ROUTES.

ACCINGTON TO COVENTRY, VIA BUXTON.  
—J.H.K.

Accrington, Haslingden, Rawtenstall, Rochdale, Oldham, Ashton, Glossop, Chapel-en-le-Frith, Buxton, Bakewell, Matlock, Derby, Melbourne, Ashby-de-la-Zouch, Atherstone, Three Pots Inn, Wolvey, Coventry.

ACCINGTON TO COVENTRY, VIA WARRINGTON.—J.H.K.

Accrington, Blackburn, Chorley, Wigan, Warrington, Tarporley, Whitechurch, Hinstock, Newport, Watling Street, Weston, Gailey, Brownhills, Castle Bromwich, Stonebridge, Coventry.

HULL TO MANCHESTER.—T.F.

Hull, South Cave, Howden, Barmby, Selby, Chapel Haddesley, Kellington, Knottingley, Pontefract, Hemsworth, Barnsley, Penistone, Mottam, Stalybridge, Ashton-under-Lyne, Manchester. 100 miles (approximately).

BRISTOL TO EDINBURGH.—D.S.

Bristol, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Stockton, Wellington (Cock Inn), Crudgington, Hodnet, Whitechurch, Beeston Castle and Tarporley Station, Four Lane Ends, Eaton, Cotebrook, Stretton, Warrington, Hulme, Newton, Wigan, Preston, Lancaster, Carnforth, Kendal, Penrith, Carlisle, Longton, Canobie, Teviothead, Hawick, Selkirk, Galashiels, Heriot, Fushiebridge, Edinburgh. Approximately 380 miles.

MIDLAND EASTER TRIAL. (See last issue.)

Rex Mundy ( $3\frac{1}{2}$  h.p. Sunbeam) approaching the top of Rising Sun. The competitor on the right skidded completely round in the loose stones.

Every motor cyclist who uses it  
is loud in his praise of it.

*The*  
**Grado**  
**Multi-Gear**  
*with Free Engine*

**T**HIS variable pulley for single-gear machines with belt drive is proving its value daily. Its advantages are so great and its cost so reasonable that no motor cyclist should deprive himself of the benefits derived by fitting this wonderful invention.

Briefly summarised, this is what it does:

It positively stops all belt slipping!

It starts your machine like a car!

It takes your machine and sidecar up hills impossible without!

It can be fitted in two to three hours to standard belt driven machines—Triumphs, Bradburys, Precision, B.S.A., J.A.P., etc.

Full instructions for fitting supplied with each pulley.

It gets you safely through thickest traffic!

It ensures safety over greasiest roads!

—In fact, it turns work and danger into a pleasure!

*Showing the  
Grado Gear  
as fitted to  
machine.*

**Read these typical letters.**

Mr. J. PEARMAN, The Bungalow, Chadwell St. Mary, near Grays, Essex, April 5th, 1916, writes:

I take this opportunity of adding my share of appreciation of your pulley. Within its range of gears it is certainly more convenient than a two or three-speed gear box; and even under trying conditions I have not experienced belt slip, even with a fairly heavy sidecar attached to the bicycle.

I am surprised to find that manufacturers have not included it as a standard fitting to their otherwise fixed gear machines.

Mr. S. F. COOK, 45, Lower Westgate Street, Gloucester, writes:

Gentlemen,—I have had one of your gears fitted on my  $3\frac{1}{2}$  h.p. Triumph motor cycle for the past twelve months, and have found it very satisfactory. You may make any use you wish of this letter.

Mr. JAMES MASON, 164, North Street, Wolverhampton, September 1st, 1915, writes:

Gentlemen,—After using your Grado Multi Pulley with free engine for six months, I feel that it is my duty to inform you that it has given me satisfaction, and I am more than pleased with it, as I have been able to climb with my 1905  $3\frac{1}{2}$  h.p. Triumph all hills I have met with, taking a coach-built sidecar and passenger. I am now able to take roads with every confidence which before having your pulley fitted to my machine I was compelled to avoid. I shall certainly recommend your pulley wherever I go.

Messrs. the Grado Manufacturing Co.,  
64, Pershore Street, Birmingham.

Mr. G. BARFF, Saracen's Head Inn and Restaurant, Warburton, Cheshire, December 3rd, 1915, writes:

Dear Sirs,—Have received pulley all right. A friend of mine has been all over Wales with one on a light machine and sidecar, which was impossible before he fitted it to his machine.

Mr. H. RHODES, Fanshall House, Pontefract, February 7th, 1915, writes:

Dear Sirs,—I have recently had one of your Grado gears attached to my  $3\frac{1}{2}$  h.p. Bradbury so that I could take a sidecar. I must say that it has surprised me, because I was wondering how on earth it could grip the belt on low gear, but it does, and takes the lot of us up hills all right. I think it is a fine and simple invention, and it seems to me it is going to be reliable, because there is no fancy watch mechanism about it.

P.S.—If this is any good you may use as testimonia.

Mr. John F. BROWNE, Bridgetown, Co. Wexford, August 23th, 1915, writes:

Dear Sirs,—I am obliged for yours re the pulley. I must say it is not only a charming invention, but most valuable, and I am delighted with it.

**We have hundreds more.**

**PRICES.**

Pulley complete (as illustrated), bored to suit engine-shaft up to $4\frac{1}{2}$ h.p.	£3 3 0
Up to 6 h.p. . . . .	£3 10 0
Lightweights . . . . .	£2 10 0
Pulleys with new ball thrust bearings:	
Lightweight . . . . .	£3 5 0
Up to 4 h.p. . . . .	£4 0 0
Up to 6 h.p. . . . .	£4 10 0

*THIS CURVED SLOT ensures the belt never slipping on the lowest gear.*

**C.** We can supply a Special Pulley for engine with Extending Crank Bosses, like the J.A.P., old Rex, Minerva, etc., for 10/- extra; recess up to  $1\frac{1}{2}$ in. diameter. Up to  $2\frac{1}{2}$ in. diameter, if necessary. 12/- extra.

**The GRADO MANFG. CO., 64, Pershore Street, BIRMINGHAM.**

Telephone—1187 Midland.

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

### Alldays.

ALLON.—All models on view; send for catalogues.—Colmore, 44, Finsbury Pavement, City. [4828]

1915 8 h.p. Alldays Combination, 3 speeds, lamps, etc.; £60.—H. Wright, Arlesley, Beds. [X8741]

ALLDAYS Allon, all models: immediate delivery: easy terms 2½ extra.—Referee Cycle Co., 332, High Holborn. [0763]

ALLDAYS Allon, 1916, 2-stroke, 2 speeds, brand new, must be sold; what offers?—Hudson, 326, Euston Rd., London. [4796]

ALLDAYS Matchless, 2-stroke, Stewart speedometer, climb anything; £20, or exchange.—H.S., 33, St. Stephen's Rd., Bow, E. [4610]

ALLON, 2½hp., 2-speed countershaft, clutch model; cost £48 with accessories last month; powerful, speedy, and absolutely perfect throughout; accept £33/10.—Pears, Oculist, Kingswood, Bristol. [X8633]

ALLDAYS Allon 2-stroke Motor Cycles from £34 to £52/10; early delivery; deferred terms from one-quarter down, balance by 12 monthly instalments. Clients purchasing motor cycles from us can practise on the private road and test hill alongside these premises before venturing out into the West End traffic, this being the only London garage in the West End possessing this facility, and also being the only London garage that is totally bomb-proof. We garage Alldays Allon motor cycles for 1/- per week, and in the event of your being called to the colours, we will store same, pending your return, for the nominal sum of 1/- per month.—Messrs. Green Taxis, Villiers St. Garage, Charing Cross, London. [4057]

### Antoine.

ANTOINE, 6hp., nearly new sidecar, 2 speeds, Bosch, smart turnout; seen running, trial; £18/10.—Spechley, 45, Church Rd., Acton. [X8737]

6 h.p. Humber, 2-seater, 3-speed, reverse, Bosch, entirely renovated and overhauled, in splendid condition; £22/10; photo.—224, Belgrave Gate, Leicester. [X8710]

HUMBER, 1913, 3½h.p., 2-speed, torpedo sidcar, new belt, nearly new tyres, machine just overhauled; £22.—Harland, Officers' Club, Rugeley Camp. [X8661]

HUMBER, 1912, 3½h.p., 2-speed N.S.U. gear, free engine, all accessories, 1915 came sidcar; must sell; perfect order; £29, worth £35.—168, Archway Rd., N. [X4589]

HUMBER, 3½h.p., 2-speed; free engine, Canoelet coachbuilt sidcar, lamps, mirror, accessories, splendid condition; £27, or near offer.—135, Woodbridge Rd., Ipswich. [X4700]

1914½ Humber, 3½h.p., 3-speed, and lamp, guaranteed not done 3,000 miles, recently overhauled by makers, splendid condition; £40.—Capt. G. Millyard, 2/1 Herefordshire Regt., Bedford. (L) [X8599]

LIGHTWEIGHT 2½h.p. Twin Humber, perfect condition, very fast, Lucas head light and generator, rear light, spare belt; genuine bargain, £18, no offers.—K., 15, Houghton Rd., Dunstable, Beds. [X4562]

## Indian.

INDIAN, new 1916 5h.p. model in stock; no waiting.—Moss, Wem. [X8751]

PRACTICALLY NEW 5h.p. 1915 3-speed Kick Starter Indian; £55.—Slaw, Langholm Rd., East Boldon, Durham. [X8762]

INDIAN, 1914½, 7-9h.p. combination, 2-speed, mileage 2,000; £48.—25, Hermitage Lane, Child's Hill, N.W. [X4641]

INDIAN, 7h.p. model F, power plus, 1916, with luxurious sidcar, brand new.—Ayscough, Penarth Hotel, Penarth. [X8574]

INDIAN, 5h.p. twin, coachbuilt sidcar, accessories, without fault or blemish; £35.—14, Dodyrooke Rd., West Norwood. [X4675]

INDIAN, 7h.p., 1914, and red Canoelet sidcar, perfect order, extremely comfortable; £50, offer.—32, St. Helens Rd., Hastings. [X8538]

1915 Indian, 5h.p., with Phoenix 1916 racing pot-ter sidcar to match, oil in perfect order; £63.—Salter, 46, Burges Rd., East Ham, E. [X4414]

INDIAN, 1914, 7-9h.p., T.T. model, clutch, extra fine condition, speedometer, mechanical horn; £35.—Layton's Garage, Bicester, Oxon. [X8715]

1914 7-9h.p. Indian, 2-speed, spring frame, electric equipment, Montgomery de Luxe sidcar, hood, screen; bargain, £52.—Langan, 292, Kingsland Rd., London, N. [X4741]

INDIAN, 1914, 7h.p., condition unscored, tyres not marked, fully equipped, 2 speeds, electric light, speedometer, etc.; only run 510 miles; £50.—Knowles, Studley, Warwickshire. [X8600]

INDIAN, 7h.p., 1914 model, with Swan sidcar, excellent condition.—Carlsh, Ltd., 314 and 316, Enston Rd., London. Tel.: Museum 3146. T.A.; Ac Carlsh, Enston Road, London. [X4624]

BRAND New 1915 5h.p. Indian, 3 speeds, clutch, done 600 miles solo work, unscored, all accessories; owner in France; cost £75, first £60 gets it.—Rector, Finningley, Doncaster. [X4768]

INDIAN, 7-9h.p., late 1915, 3-speed, rear sprung, and Millford sidcar, electric and acetylene lighting, every imaginable accessory, absolutely perfect; £55.—14, Dodyrooke Rd., West Norwood. [X4674]

INDIANS, model B £70, model F Powerplus £90, and C Powerplus £75; also sidecars to suit; exchanges; deferred payments if desired.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [X4433]

INDIAN Late 1913 Combination, 2-speed, clutch, kick starter, Indian 20 gns. sidcar, lamps, horn, excellent condition throughout; trial given; exceptional bargain, 37 gns.—1, King St., Acton. Phone: 1578 Chiswick. [X4718]

1914 7-9h.p. Indian Road Racer, clutch model, in excellent condition, good speedometer, lamps, horn, and tyres, one tyre new; £32, no offers; on view Monmouth; owner at Frost—Box L1,249, c/o The Motor Cycle. [X4377]

## Ixon.

1915 Ixon, 2½h.p., accessories, splendid condition; £18.—Empson, Gillingham, Sandy, Beds. [X4656]

IXION, 2-speed, footboards; immediate delivery; exchange.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [X4396]

IXION-PRECISION, 4h.p., special engine, and de luxe coachbuilt sidcar, wind screen, locker, and special cover, 3 speeds, free, best Lucas lamps and generators, Lucas black horn, mirror, and £5/5 Cowey speedometer, 2 spare valves and tappets complete, new spare driving pulley, 2 tyres, new tube, spare belt, and new spare carburettor, College leg shields, guaranteed, just on 3,000 miles; lot £44, called up, no carriage paid, cost £94.—Emery, Marlow, Upper From., Caversham. [X4714]

## The Employment of Prisoners on the Roads.

**R**EPLYING to questions asked in the House of Commons last week, Mr. Tennant said that, in addition to work found for German prisoners of war in this country in their camps, such as making mail bags, a number were employed in works of public utility, such as labouring on farms and *road making*, at several places in the neighbourhood of their camps, and arrangements were now being worked out for their employment on an extensive scale in timber cutting and work in mines; but as such work would take them into districts which were, as a rule, but scantily populated, somewhat extensive preliminary preparations were necessary. It was a fact that Germany had employed her prisoners in agricultural and other work of a nature to give economic help to Germany. It was hoped to solve shortly the difficulties which had hitherto been found in employing prisoners in small parties, such as were required by farmers, when it was not possible, owing to distance, to accommodate them in camps. We regard this decision as good, if somewhat belated. Readers will remember that we advocated the employment of prisoners of war for road work more than a year ago—to be precise, on March 25th, 1915—but, of course, we recognised that many difficulties would have to be overcome and suitable arrangements made before it would be safe to entrust bodies of such men with tools in sparsely populated districts, and we think the Government have acted wisely. Much work needs to be done upon our main roads, and the sooner it is taken in hand and the more thoroughly it is carried out the better, for the damage caused to our highways by military transport has been very great. Country lanes have, of course, not suffered so much from military traffic in most districts, but the lack of labour has made itself noticeable in many places. This combined with the extremely bad weather experienced during the

winter has left the roads in very poor condition. Unless this damage is rectified in the near future it is likely that the foundations of many of our roads will have to be entirely rebuilt before the pre-war surfaces can be restored, or the roads rendered really satisfactory.

## Tyre Imports Prohibited.

**T**HIS is an age of restrictions and prohibitions, and consequently the decision of the Board of Trade to prohibit in future the import of rubber tyres produced in countries abroad will create no real surprise. As a matter of fact, the decision was reached at the time motor vehicles were prohibited, but we believe that in consequence of pressure put upon the authorities the restriction applying to tyres was removed, only, however, to be reinstated a few months later. The move, of course, is by no means intended as a set against our Allies or friendly neutral countries. It is of the greatest necessity in the interests of the nation to retain in the British Isles the gold necessary to carry on the war, but this object cannot be achieved by importing goods, the demand for which home manufacturers are well able to cope with. It is but one link of a chain all designed to attain the same end, and there seems to be no question of doubt that—at any rate so far as our Allies are concerned—the prohibition will be waived as soon as the war is over, even if an import tariff be instituted.

As regards prices, seeing that stocks of rubber tyres in these Isles are not really low, it is not considered that these will be raised for some time to come at any rate. The amount of motoring being done compared to pre-war days is infinitesimal, and what is indulged in is purely recreative or by men on business bent, so that the consumption of tyres does not nearly approach the level of the days of peace. There are many other things to which this prohibition might with advantage be also made to apply, but we will not attempt to enumerate them all.

### Gott Strafe England!

I possibly suffer from the unenviable distinction of being the only Englishman whom the Germans do not hate! At any rate, I have just received news from a civilian interned in the big concentration camp at Ruhleben that he has read one of my articles reprinted in a German motoring journal, which referred to me in quite complimentary fashion!

### Wheeling a Heavyweight.

A veteran rider remarked to me the other day that he had regretfully taken to the baby two-stroke, because increasing years had not lightened the labour of wheeling his pet 7 h.p. twin about when its engine was temporarily at rest. The obvious answer was, "Why wheel it?" The heaviest twins are easily manipulated if the rider straddles them with the clutch out, in lieu of leading them about by the handle-bar.

### Decarbonisation on Car Engines.

Readers who are *au fait* with the trend of motor car design will be aware that decarbonisation problems are being tackled with real earnestness in that sphere. Until the last year or so, the decarbonisation of a motor car engine was a perfectly fiendish job. It necessitated the removal of either one or two heavy castings, consisting of from two to four cylinders, complete with their heads and water jackets. It was barely possible for a Hercules to tackle it single-handed, even with the aid of blocks, chains, and hooks; if he did, it would take him many hours. The normal procedure took two men the best part of a day. Then the detachable cylinder head became increasingly popular, but even this improvement fell short of the ideal. It enabled an amateur to decarbonise a four-cylinder 20 h.p. engine single-handed in two hours; but it rendered the valves extremely inaccessible, as valve caps were eliminated; and if piston rings required attention, the piston at fault had to be drawn out through the bottom of the crank case. *Per contra*, some authorities hold that the elimination of the valve caps reduces the tendency to knock (usually called "pinking" by car drivers), as each valve cap represents a lump of almost uncooled metal, and so leads to uneven expansion, and to steam pockets in the water jackets. The car world is now moving towards the following design of engine: (1) Detachable cylinder head; (2) including overhead valves, which come away with the "loose head"; and (3) the cylinder barrels being cast separate from the top half of the crank case, so that the piston rings are accessible from above in the event of their failing.

### Decarbonisation of Motor Cycle Engines.

It is obvious that the above progress is on lines adapted to vertical four-cylinder engines, and is, therefore, largely devoid of meaning for users of motor cycles, amongst whom the four-cylinder engine is little known. Still, several deductions may be drawn. A four-cylinder engine of this type, if mounted in a two-

wheeler, would be free from the only important criticism to which four-cylinder motor cycles are at present subject. Again, decarbonisation is an even greater nuisance to us than it is to car owners; and whilst the nuisance is being annually reduced for car owners, it is actually becoming worse amongst us, as the various types of twin-cylinder gradually gain the mastery over the vertical single-cylinder. Our designers ought to be doing something. Car design suggests that the detachable cylinder head, with overhead valves, is the way out. So far as motor cycles are concerned, this would only be a return to the original De Dion practice of fifteen years ago; and it is now emphasised by the probable introduction of steel cylinders on future engines. At the present moment, the job of decarbonising most horizontal twins and all the big V twins is about as long and toilsome as it can possibly be. But it is plainly an easy matter:

(a) To construct a simple and gasproof joint between a cylinder barrel and its head.

(b) To construct overhead valves, which are fracture proof.

This single alteration would reduce the time required for decarbonising many twin-cylinder engines by about 75%. Why are our designers so unnecessarily stationary?

### Four Speeds v. Three.

The average motor cyclist regards the provision of a fourth gear ratio as an academic question (if he is a 'Varsity man') or as a talking point (if he has trade connections). I will go so far as to say that no rider accustomed to four gears will readily return to three. The position is as follows. You must have your top gear pretty high for road-burning and ticking down grades. You must have a real emergency low gear, which will rule out mountains. Between these extremes you may either have one intermediate ratio, which must serve two functions—it must take you along at a decent speed under circumstances where the top gear is just too high, and it must give you violent acceleration on hills where a top gear rush is impracticable, or moderate acceleration where the going is too tricky for lively work on a  $4\frac{1}{2}$  gear, e.g., in thick traffic. Now a single intermediate gear ratio can only combine these two functions on a very light and powerful machine, where the percentage of power to weight is rather high, e.g., on a  $3\frac{1}{2}$  h.p. 150 lb. T.T. pattern mount. On heavy solo machines, and *a fortiori* on sidecar machines, you very often need a gear which is only fractionally lower than top gear—say,  $5\frac{1}{2}$  instead of  $4\frac{1}{2}$ —but a  $5\frac{1}{2}$  gear means a slow get-away in traffic or round a bad corner at the foot of a steep pitch; and in sidecar work this slight reduction down to second gear is useless. So the three-speeder usually has a compromise intermediate of  $6\frac{1}{2}$  or  $7\frac{1}{2}$ , which is either too high or too low to be ideal in nine cases out of ten, but the four-speed box gives you all you want.

# THE FIRST THOUSAND.

An Officer's Impressions of a Big Single Sidecar Outfit.

The 4 h.p. Norton sidecar referred to in the accompanying article.

**T**HE following notes on the running of a big single sidecar outfit may interest those readers who are already sidecarists, and may convince some who are contemplating the acquisition of a sidecar that it is not at all necessary to indulge in a big 1,000 c.c. engined twin in order to enjoy thoroughly satisfactory sidecaring.

The machine in question is a 1916 4 h.p. Norton three-speed countershaft machine and a sporting model Norton sidecar.

The engine is the 82 x 120 mm. 633 c.c. long stroke single, which Mr. Norton has designed primarily for sidecar work. The cylinder casting is a good piece of work, and usually excites admiration because of the sensible size and disposition of the cooling fins. The crank case is devoid of all dirt-lodging crevices, and is remarkably oiltight even under the extremely liberal lubrication to which I treat my engine.

The C.A.V. British magneto I have enclosed in a home-made leatherette shield, and will interest me no more until the engine goes into dock for a clean up. The plug I am using is my sole remaining memento of Hun-land, to wit, a single-point Bosch.

Air funnel attached to Binks carburetter with lamp wick to catch blow-back petrol.

A Binks three-jet carburetter supplies the gas. With No. 2 petrol I am using jets No. 00, 4, 8 respectively. I have removed the bottom air adjustment clip and fitted a long air pipe, retaining the gauze at the inner end of the pipe. I find that dirt does not choke up the gauze nearly so quickly when it is placed in this position as when the gauze is placed over the end of the main air pipe.

On the bottom of the air pipe I have placed a strip of thin lamp wick. The petrol "blow back" is absorbed by this wick, and is vaporised by the ingoing air. The plain air pipe naturally catches this blow back, but gives it up to the ingoing air in an improperly

vaporised condition. The wick gives the petrol up in a very finely atomised state. The idea is at present being tested, and I have come to no definite conclusion about it. I should like some opinions on it. My carburetter is certainly *delightfully automatic* and *economical* since fitting the above.

## The Silencing Arrangements.

I have had a plain T.T. exhaust pipe fitted in place of the standard tangential silencer and pipe. I enjoy the deep rumble that issues from the region of my back wheel when the engine starts, but unfortunately the police authorities have no ear for music, so I have had to devise a means of putting on a pianissimo stop.

Exhaust pipe extension and quietening device.

A piece of steel tubing 8 in. long, which was just a tight fit over the end of the T.T. pipe, was chosen. I drilled about eighty  $\frac{3}{16}$  in. holes in it, and over one end I fitted a hinged lid, also perforated by a number of  $\frac{3}{16}$  in. holes. This fits over the end of the TT pipe, and in towns the lid can be closed down, and the engine exhausts with remarkable silence through the small holes. In the open country open exhaust can be enjoyed with a reasonable degree of silence.

## The Transmission.

The gear box fitted is this year's Sturmey-Archer countershaft, and to my mind it is the finest one extant. It is as near foolproof as anything can reasonably be, and gear changing can be done with the ease and silence of a Rolls-Royce gear box. I have the chain-cum-belt model, giving me 5.14 to 1 top gear,  $8\frac{1}{2}$  to 1 second, and about  $13\frac{1}{2}$  to 1 bottom. When sent out the machine was fitted with an engine sprocket giving higher ratios. The fitting of the lower ratio sprocket has been a great improvement in respect of flexibility. Naturally top speed on the level has dropped (about 5 m.p.h.), but the average road speed has improved.

### The First Thousand.—

The clutch (cork insets h.b. controlled) has been a treat. I am contemplating fitting dual control to the clutch operation by fitting a pedal and Bowden wire stop on the right footboard. I can thereby utilise the one Bowden wire for both hand and foot control.

Belt wear has been excellent. Slip has been practically non-existent, and the breaking of one fastener hook has been the only trouble to record. I am using a Lycett rubber-leather belt, and it is doing very well.

### A New Cooling Device.

To add to the efficiency of my engine I have designed and made an auxiliary radiating system, using copper, with its high specific heat as the most suitable medium, and I flatter myself the appearance is considerably less unsightly than the average auxiliary radiator set. The copper takes on an excellent shine and looks very well. I hope in a short time to give some figures, temperatures, etc., which will substantiate the opinion I already have of the efficiency of my device. On starting the engine, with the machine stationary, the radiators soon become warm and then moderately hot. In 200 yards after starting the heat has been almost entirely dissipated. Hills such as Dover Castle, Folkestone, etc., can be roared up on second gear *all out* 25-28 m.p.h. with the back of my bare hand pressed on either radiator. Within twenty-three seconds of stopping the radiators become unbearably hot to the bare hand, showing there is efficient heat conduction between cylinder and radiators. Lubrication under these circumstances is excellent, as the oil in the cylinder walls never attains to a very high temperature. I expect to find that carbonisation will be markedly reduced, and my petrol consumption over the same roads, etc., has improved from 68 m.p.g. to 72-74 m.p.g. Considering that my running is mostly done in a hilly portion of Kent, and involves about five miles of traffic work for every nine or ten miles of open country, I consider my petrol consumption is quite good. I have hopes of testing it on a long run, and am counting on over 80 m.p.g.

### The Arrangement of the Controls.

Wide semi-T.T. bars give excellent control of the machine, but are not so comfortable over a long distance as the much maligned T.T. bar. Terry's links have replaced the pair of rigid links at the top of my Druid forks, and I know of no better 12s. 6d. worth that can be spent on a machine. They absorb the

more horizontal road shocks that escape the damping of the main Druid springs, and render the handle-bar as vibrationless as a well sprung sidecar. To watch them at work on a pot-hole road is a revelation. They absorb vibration like a blotting paper soaking up ink.

My clutch control I have placed at my left hand, valve lifter and throttle controls together on the right bar, and the seldom used front brake lever I have placed in the inside position on the left bar. This I have found the most convenient arrangement.

The sidecar is the Norton sporting model, semi-streamline body, disc wheel, all finished in lilac blue. Four-point attachment to the excellent

Norton frame sidecar lugs is used. My sidecar can be detached or coupled up in a very few minutes.

The sidecar is very comfortable to ride in, and the very accessible locker behind the passenger in the bulbous tail is a convenience that must be experienced to be appreciated. Petrol, oil, and wet weather riding apparel can be conveniently stored here; and, thanks to excellent suspension of the sidecar body, they do not shake about.

The outfit holds the road excellently, steers well, and is very comfortable for both driver and passenger. When geared about  $4\frac{1}{2}$  to 1 I have attained 51 m.p.h. on the level with a ten and a half stone passenger, so that the engine has got plenty of vim in it.

### Easy Starting.

The reliability has been monotonous. I have not needed to apply a tool to the machine, except to replace a broken belt fastener hook. The engine starts every day I use it first or second kick from cold, *no injection*, and does its day's work with the regularity of a Waltham watch.

I always feel sorry for those riders who write *The Motor Cycle* for advice on their engine starting troubles. Copious injections of petrol overnight or just previous to their daily struggle, frantic pushing

or kicking at a starter, can all be avoided by a little care and adjustment carried out by the rider himself.

For lighting the outfit I have two F.R.S. head lights supplied by a Low generator. With varying lighting restrictions everywhere, the controllability of the flame given by this generator is most enjoyable. The generator certainly does everything the makers claim for it. My Dunlop tyres still have their original quota of air, and wear of studs is not yet in evidence. To say I am pleased with my outfit is superfluous.

ALEXANDER LINDSAY, M.B., CAPT., R.A.M.C.

Arrangement of control levers on Capt. Lindsay's Big Four Norton.

The Big Four Norton, showing auxiliary copper cooling device designed by Capt. Lindsay.

The 6 h.p. P. and M. taking the bend on Combe Bottom. At the point shown the gradient is 1 in 5; the P. and M. climbed the hill twice in succession with a full load.

UP to within a short time ago we had had very little road experience of the new 6 h.p. (76 mm.  $\times$  85 mm.) 90° P. and M. twin, but when the invitation was received from Mr. B. Mariani to take an extended run in one of these combinations we accepted it with alacrity. It was as long ago as November 19th, 1914, that we described this fine machine, and since that period some little improvement has been made, but naturally as the whole of the firm's output has been taken over by the Government, very little attention has been devoted to the new model.

#### The Four-speed Gear.

At the present time it has reached the stage of almost complete finality, with the exception of the change speed gear mechanism, which still needs simplification. We may recall that the P. and M. four-speed gear box is a combination of the dog clutch gear and the well-known expanding P. and M. The dog clutch gear merely serves the purpose of lowering the ratios of the P. and M. gear, and no matter whether the gear box is in use or not the expanding gear serves as a friction clutch on either of the speeds. The small lever shown on the tank in the illustration is drawn backwards so that the dogs are engaged. This means that the two lower gears are in operation. Therefore to start, the pedal on the gear box is kept horizontal; this puts the gear in neutral. To start, the pedal is pressed down with the heel and the drive is taken up on the low gear, while pushing forward the pedal engages the second speed, but to engage the third speed the pedal and the lever have both to be actuated at the same time. To engage the top the lever only is pushed straight forward, and the exhaust valve lifted or the throttle shut. The company is now engaged in designing a simple gate which will enable all these operations to be carried out by means of one lever.

The chief modification in the machine in which we were taken out is the dynamo drive, which is taken

off the layshaft of the gear box and is carried out in a very simple and efficient manner. A detail improvement has also been made in the actuation of the dog clutches; this is now carried out by means of a rack and pinion operating the worm which moves the fork in the gear box and shifts the dogs.

The outfit reached the appointed place dead to time, and within a very few minutes we were ably piloted westwards out of London by Mr. Chidley, one of the P. and M. demonstrators. Emerging from Roehampton Lane at Alton Road, which is quite a respectable gradient with a sudden approach, the machine astonished us by climbing on top speed, especially as it is a hill which calls for a change down on most motor vehicles. Kingston Vale is exceedingly rough, and over this surface we were pleased to note the exceedingly comfortable riding of the sidecar. The back possesses a

very deep spring cushion, and the body itself is, moreover, suspended on very carefully selected C springs, which render the riding most luxurious; in fact, it would take a very expensive car to provide such comfortable riding as the P. and M. sidecar affords. Kingston Vale was taken at a very comfortable speed, and here we appreciated the even running of the engine and the absence of vibration.

Our journey was continued along the main Portsmouth Road, past the Hut, and on through Ripley to the fork a mile from that village, where we turned to the left, and went through West Clandon to Newlands Corner, taking the hill which was the scene of the Army and Navy hill-climb last autumn. This caused another surprise, as the engine comfortably took that quite considerable gradient on third speed, and accelerated well after the first bend had been negotiated. All the time we had been travelling against a very stiff north-westerly gale, but this happened to be more or less in our favour as we took the hill. Near the summit rain came down in torrents, and we stopped for shelter under some friendly trees. Here we met several wounded soldiers from an adjacent hospital enjoying an outing in the country. Two were walking, one was driving a pony chaise, when suddenly another pony chaise came hurtling down the hill "all out" with the seat empty, and the pony apparently out of control. The pony made for the sidecar like a bull at a gate, but fortunately saw it in time and swerved to the left, missing a water cart by a hair's-breadth, and bolted away out of sight. Its acceleration as the gradient increased must have been extremely rapid. What happened to it we know not. The incident evidently caused no little amusement to the one or two convalescent men who followed afterwards.

#### Up Combe Bottom.

We next made our way down the beautiful road which flanks the hill, from which the finest view is

**The 6 h.p. P. & M. on the Road.—**

Surrey can be observed, and, passing the Silent Pool, we made for Shere. At the entrance to the village there is a signpost pointing to Effingham and Leatherhead. Taking the acute angle curve we made our way up the country lane which ultimately terminates in Combe Bottom, a well-known Surrey test hill, which was included in the One Day Trial some three years ago. Even now it is not very well known, and it is quite a good test. The surface was extremely rough, and became worse as we got higher, and necessitated a change to third speed, especially as we had received a rather bad check at the bottom through meeting a herd of beautiful Jersey cattle. The surface, though rough and loose in places, was negotiable, but at the corner, just where the gradient is 1 in 5, the road was tolerably good, and the climb was made in excellent style on second speed. Here we stopped and took a few photographs, then continued over the high land and through the woods, whose winter sombreness was just beginning to be relieved by the vivid green of the budding larches.

Then we joined the Leatherhead-Guildford road, following this as far as Effingham, where turning left again we met the Portsmouth Road, and stopped at the Hut for tea.

**A Tenacious Mount.**

Afterwards we took over the combination and found it to be exceedingly comfortable to drive, possessing ample acceleration, wonderful staying power, smooth running thanks to the excellent balance of the 90° twin, plenty of power, but not very much speed, though we must admit we did not attempt to push it at any time. It gave us the impression of being an exceedingly comfortable machine which was capable of keeping up an even pace all day and under all conditions.

There is practically no slowing for hills, and the way the machine battled against the heavy head wind on the outward journey was quite a revelation. The position of the driver was comparatively as comfortable as that in the sidecar, and certainly the Lycett saddle on which we were seated was exceedingly well sprung. We found the change speed with the two pedals and lever not too difficult. The only real difficulty was the foot brake, which is placed on the

**A SIDECAR OUTFIT DE LUXE.**

The 6 h.p. 90° twin P. and M. This machine is not at the moment on the market, though it has been on the road eighteen months. Upon the conclusion of peace it will be offered to the public as a thoroughly tested article. Dynamo lighting, a four-speed gear, and all enclosed chain drive are features.

near side of the machine instead of the off side, where we had been accustomed to find it with our old reliable 3½ h.p. of the same make.

Altogether it was an exceedingly enjoyable ride, and we found the machine, after practical road experience, to be in every way worthy of the famous firm which produced it. Although times without number the engine was allowed to slow down to such an extent that any ordinary engine would have konked itself to a standstill, the new 90° P. and M. twin stuck to it magnificently, and never a sign of a knock or konk could at any time be discerned.

**LOADING UP MILITARY RUDGES.**

Twelve of these were returned to the factory for repairs, and they were in such bad condition that the work cost over £180. Only necessary repairs were carried out, as the machines, so the makers were informed, "were for the training of novices." Surely it would be better to enlist expert riders for the despatch riders' section of the R.E.!

## MILITARY NOTES.

News of Military Motorists from Many Parts.

## MUD IN MESOPOTAMIA.

WE have heard a good deal of mud in Flanders and mud in Macedonia from the military motor cyclists' point of view. But mud with riders in Mesopotamia has not been called attention to before now. However, the photograph we are enabled to reproduce, through the courtesy of Motor Cyclist R. V. George, who is attached to an M.T., A.S.C., Company in Mesopotamia, shows that it is not only in Flanders and around Salonika that our despatch riders find the roads rough going at times. Strictly speaking, a true comparison cannot be made between France and Mesopotamia, as the former has roads, however bad they may be at times, whereas in the case of the latter it is desert pure and simple.

The photograph provides a graphic idea of the camel track mud, in that the machine—a 1915 Triumph—is standing up without stand assistance. The machine is standing just as George got off it. In the wet season the camel tracks are most difficult to follow, as well as being trying to ride upon.

A REMINISCENCE OF THE  
"CLAN MCTAVISH."

READERS will remember the description in *The Motor Cycle* a few weeks ago of the experiences of an Australian on board the *Clan McTavish*, the boat that put up such a plucky fight with the German raider, the *Möwe*. The Australian in question, Arthur Du Bois, of Sydney, was on his way home to enlist in the Motor Machine Gun Section, but he gave his parole to the Germans who captured the *Clan McTavish*, and consequently, when he finally landed in England, the Foreign Office refused him permission to take up combatant service. However, Du Bois is now driving a car for the Society of Friends, who are doing so much good work for the refugees behind the firing line in France. At present he is stationed about twenty-five miles from Verdun, and when the wind is in a certain direction he can hear firing quite plainly.

## BETTER THAN THE TRENCHES.

AT a mechanical transport depot near London the motor cycle men sleep in what were at one time horse boxes. The men have made them extremely comfortable, and besides being used for sleeping purposes—four men to each box—they are also used for the storage of motor cycles.

## TRACING WAR-MADE FRIENDS.

PUBLICATION in our Military Notes of letters (the last in our issue of April 27th) from P. O. G. L. Rossiter has led to a reader, who was a

"SOME" MUD.

A military rider's Triumph standing up in the mud without stand assistance on the road to Zubair, Mesopotamia.

comrade of his in the early days of the war, hearing of his whereabouts. The reader in question, R. L. Nye, who is now a despatch rider with the Royal Flying Corps, was with Rossiter at an R.N.A.S. camp near Dunkirk, and the two had many a game of ship's quoits together.

On several occasions our "Naval and Military Notes" have been the means of war-time acquaintances tracing one another.

## THE ACTIVE SERVICE PRESS.

TO the list of papers published, and in many cases printed also, just behind the firing line in France, given in our issue of March 23rd, must be added that named *The Brazier*, and through the courtesy of a reader who is in the

A.S.C., M.T., we have had an opportunity of seeing a copy of *The Brazier*, which is printed at the Front by the 16th Battalion the Canadian Scottish. *The Listening Post*, by the way, is also the publication of a Canadian regiment—in this case, the 7th Canadian Infantry Battalion. Both are excellent publications, and contain some very amusing portions.

We have just received the April, being the second, number of *On Service*. It is published at G.H.Q. by the members of an A.S.C., M.T., Ammunition Park. It is even more amusing, if that were possible, than the first number. Lt. S. A. Rowlandson is publisher, the paper being edited by one of the park sergeants with the assistance of the N.C.O.'s and men.

PERTH (W.A.) MOTOR CYCLISTS  
ON ACTIVE SERVICE.

TWENTY-FIVE members of the Perth (Western Australia) Motor Cycle Club are now on active service. Perth is not a large place—the population is only 36,000—so that it is quite a good record.

## THE DANGERS (?) OF DESPATCH RIDING.

IN our issue of April 20th, page 376, we drew attention to a lurid account, in an American contemporary, of the dangers to which despatch riders are exposed when on duty. It was stated that out of a corps of thirty-one riders with whom the writer started on duty at Ypres only four were alive when he left.

Needless to say, this is a greatly exaggerated statement, and if any proof is required it is furnished by a letter from a D.R. attached to the 50th Div. (Northumbrian) Sig. Coy. This section has served in France for over twelve months, and so far it has never had a casualty due to shell fire or other similar risks.

The members of the section are shown in the illustration on this page.

Despatch riders of the 50th (Northumbrian) Division Signal Company who have seen over twelve months' active service. From left to right (front row) Cpl. L. Barton, Art.-Cpl. C. Armstrong, Cpls. Duffy, O. Birse, and Crute; (middle row) Cpls. J. Wood, Taylor, W. Dixon, Sgt. Bartram, Cpls. Todd, T. Hudson, and Baker; (back row) Cpls. T. Turnbull, F. Monty, Thornton. Preston, and Hacking.

## EMPIRE SIDECARS.

Large Range of Models from a Splendidly Equipped Factory.

Military and lightweight models of the Empire sidecars.

**A**MONG the many different sidecars manufactured by Messrs. Lowe's Empire Sidcar Co., of Great Charles Street, Birmingham, probably the most attractive is the "Military" model. This has been specially designed for hard work, and is being supplied in large quantities for service purposes. Its general appearance is very pleasing, while the careful attention to detail, combined with good workmanship, make it a most suitable outfit for really hard work.

The main chassis is rectangular in shape, and is built of extra heavy gauge cold drawn weldless steel tube. The wheel is supported on both sides by means of a special frame constructed to carry it. The wheel is thus carried in a similar manner to the rear wheel of a cycle, which entirely does away with any risk of broken or strained wheel axles. Although the wheel is entirely enclosed by the frame, the accessibility for tyre repair is practically unaffected, as it is very readily removed. The forks in which it is supported are slotted, so that directly the nuts are released the wheel drops downwards, and can then be easily removed from the frame. When in position the wheel is securely locked in the frame by two recessed washers which fit over the spindle and engage in a corresponding recess in the auxiliary frame. Between these recessed washers and the locking nuts are two washers

honeycombed with holes. The wheel is then locked up by the usual spindle nuts, which are prevented from unscrewing by a set screw which engages with the drilled washers.

### Mudguard Attachment.

An extremely good point about the chassis is the method of attaching the mudguard, owing to the fact that the frame encircles the wheel it is possible to support the guard from both sides, and the fact that it is attached at several points eliminates to the greatest possible extent any tendency to rattle. The guard is wide and fitted with a deep valance. A most substantial stand is provided to jack the wheel up for adjustment or tyre repairs.

Four-point attachment is adopted, and a variety of clips may be obtained suitable for practically all the leading makes of cycles. The connections are all quickly detachable, and consist of heavy steel forgings of a rather novel design. The two sockets which fit one within the other are held tightly together by means of a flat wedge-shaped bar, which is driven into a socket machined through the two fittings. When tight, it is locked firmly in position by means of a set-screw.

The diagonal rear attachment stay on all Empire models is attached to the chassis as near the wheel as possible—a very sound construction, and a point often

omitted in modern sidecar construction. The body is sprung back and front, the rear springs being of the C variety with shackles, while the front are flat laminated. The plates on which the springs rest are all brazed to the chassis, the springs being clamped down by substantial plates and bolts. A point worthy of note is that all nuts are castellated and fitted with split pins.

The body is of the coachbuilt pattern, and is made of hydraulically pressed steel panels. It is thoroughly well upholstered, and can be finished in any colour to match any machine. A similar model to the Military is the Empire American, this being fitted with a 28in. wheel, and painted to suit the leading American machines.

### The Lightweight.

Another interesting model is the lightweight. In this model the sporting shaped body is underslung through the rectangular chassis, so that a very low riding position is obtained.

During our visit to the Empire works we were much impressed by the size and the completeness of their equipment. We understand that, although the firm is fully engaged on executing Government contracts, it is in a position to supply and give prompt delivery to the trade or public with practically any of its models, owing to an enormous reserve stock.

## A CHEMICO BODY SHIELD.

**W**E were present on Wednesday last week, at Anderton's Hotel, at the demonstration of the Chemico body shield, lately introduced by the County Chemical Co., Ltd., Bradford Street, Birmingham. The body shield consists of a waistcoat which may be used to protect the front and also the back of the body from bayonets, bomb splinters, revolver bullets, shrapnel, and other projectiles, except those of high velocity unless they be more or less spent. The shield is composed of a series of forty-two strips of material, treated with a resin-like chemical, and arranged somewhat in the manner of the slats of a venetian blind, while khaki colour

cloth covers the whole. Though thick, it is light, weighing 4½ lb., while it is also waterproof. There is no metal whatever in the body shield. In explaining the claims for it, Mr. Wilfred Hill, chairman of the company, said that he considered it to be also invaluable for the protection of the tanks of aeroplanes, motor cars, and motor cycles. It covers a large area of the body, and is treated with a chemical which renders it anti-septic. The first test consisted of an attack on the body shield, which was strapped over a large sack of bran, by a soldier armed with a rifle and bayonet. The soldier lunged vigorously at the dummy, but did not succeed in pene-

trating the body shield. Next about ten shots from a revolver were fired at it, and of these only four succeeded in penetrating the material, which was explained by the company as being due to the fact that the dummy had been dented by the attacks of the bayonet. We should have been interested to have seen the effect with an automatic pistol, which has a muzzle velocity of about 1,150ft. per second, against the 750ft. per second muzzle velocity of the .455 Service revolver. We are confident, however, that the body shield would be capable of saving a number of casualties such as are inflicted daily by half-spent projectiles.

# THE DUBLIN EASTER TRIAL.

A Belated Report of an Event that had an Exciting Ending.

OWING to circumstances that do not call for any apology from us or from our usually reliable Irish correspondent, beyond a statement that the six days rebellion in Dublin somewhat upset the wonted regularity of the postal and telegraphic communication with the Emerald Isle, we were unable to publish in the usual course a report of the one day trial of the Dublin and District Motor Cycle Club held on Easter Monday. And for the reason that most of the members of the club since that date and up to the present have been "on active service" in their native city, and district as members of the Motor Cycle Volunteer Despatch Riders' Corps, no results of the trial are available, although in the ordinary course of events they would by now be ancient history. The trial has, however, an historic interest, if only by reason of the fact that it will probably be the last event of the year under the auspices of the club.

When the competitors reached Donnybrook on the conclusion of the trial on Easter Monday afternoon they heard of the insurrection that had taken place in Dublin during their absence. They were inclined to regard it as a joke, and were little upset by the news that no trams had run from mid-day; but those of them who had to cross the city to reach their respective homes soon found it was a joke of a very serious nature. Of their adventures—perilous adventures in many cases—much might be written, but the columns of *The Motor Cycle* are hardly the place to record them. Suffice to say that none suffered any casualties.

## The Starters.

The competition took the form of a reliability trial over a distance of about 145 miles, the greater part of the course lying amongst the mountains of Co.

Wicklow. It looked at one time as if it would be impossible to hold the event, as, owing to the pronounced shortage of petrol that had been experienced in Dublin for some time past, it was with great difficulty that the club was able to arrange for a supply at the turning point at Woodenbridge. The uncertainty as to the event coming off caused the entry to be on the small side, only thirteen names, being sent in for the event, and of these twelve took part, their names being as under:

W. J. Henderson (7-9 Harley-Davidson sc.)  
T. Woods (2½ Allon)  
D. Doolin (2½ Douglas)  
S. Allen (3½ James)  
P. H. Hurse (4¼ B.S.A.)  
P. J. Fox (3½ Sunbeam)  
L. Carter (7-9 Excelsior sc.)  
S. Redmond (3½ Indian)  
C. B. Franklin (7-9 Indian sc.)  
A. Carton (7-9 Indian sc.)  
M. C. McDonough (4¼ B.S.A.)  
W. T. Jameson (5 Indian)

The start took place from Inchicore, and the competitors were sent away at one minute intervals from nine o'clock.

## A Sporting Route.

The route ran through Rathcoole, Naas, and Ballymore-Eustace, where the men

turned eastward to Hollywood, crossing the mountains by Wicklow Gap. The long ascent was in fair order, and few of the competitors were penalised. From Laragh the military road was followed over the mountains to Drumgoff, and from the valley of Glenmalure to Aughavanagh and Aughrim, and thence down the valley to the luncheon place, at Woodenbridge.

After an hour's interval the return journey was resumed, and the route was traversed in the reverse direction as far as the Vale of Clara, this section proving no less severe than when taken from the north. The competitors then proceeded to Rathdrum, Rathnew, and Ashford, to make once more the ascent of the mountains by Ballymacroe Hill and Roundwood to Sally Gap. From that point the military road was again followed to Glencree Reformatory, and, after passing through the valley of Glencree, the last test hill of the day, the Devil's Elbow at Glencullen, was tackled. This proved a very severe climb, but all of those who survived up to this point succeeded in climbing it.

The weather conditions were very bad for the greater part of the day, and the

(Top) Waiting in the Vale of Glenmalure. The riders, left to right, are: C. B. Franklin, S. Allen, and W. J. Henderson. (Left) D. Doolin (2½ h.p. Douglas) checking in at Woodenbridge. On the left is P. J. Fox (3½ h.p. Sunbeam) and on the right T. Woods (Allon).

### The Dublin Easter Trial.—

severity of the course resulted in the proportion of finishers being remarkably small. Those who finished were:

T. Woods (2¼ Allon)  
C. B. Franklin (7-9 Indian sc.)  
P. H. Hulse (4¼ B.S.A.)  
L. Carter (7-9 Excelsior sc.)  
A. Carton (7-9 Indian sc.)

Owing to the rebellion, the military authorities have taken charge of the petrol supplies in Dublin, and none of the importers can deliver spirit to civilians without a military order. This

does not mean that supplies are altogether unavailable. Spirit is being issued in limited quantities to retailers, and they are free to supply their customers.

### NOVEL VALVE GEAR.

THE accompanying sketch shows, a novel method of overhead valve gear, the novelty being in the bevel drives. It is a patented design of an American, Andrew Strand, of St. Paul, Minn., and the object is to lessen fric-

tional stresses caused by the valve gear and thus obtain more speed. The design involves the use of seven pairs of bevels, and we understand that it is being employed on the twin-cylinder Cyclone models.

Bevel-operated overhead valve gear mechanism used on an American machine.

From the drawing it will be noticed that the main shaft carries a bevel pinion meshing with a bevel gear on the end of a shaft parallel with one of the cylinders.

The forward shaft carries another set of bevels to drive the shaft for the rear cylinder of a twin-cylinder engine and a third set to drive the magneto. The valves in each case are operated by cams on an overhead shaft acting upon their respective rockers.

Scene at a control. The figure on the left is D. S. Jameson (5 h.p. Indian), a midshipman on H.M.S. "Canada," who took part in the trial.

## The Instanter Vulcaniser.

WE have received a sample of the Instanter vulcaniser from Morris, Russell and Co., Ltd., 75, Curtain Road, E.C. It is claimed that a tyre repair can be effected by its aid in ten minutes.

To repair a cut or puncture the tube is first of all nipped together with the fingers exposing the cut or puncture. The edges are then cut with the scissors, which makes the hole a little larger, and leaves the edges ready for repairing. Next the tube is rasped round the hole, as in the case of vulcanising by the hot process; the cut is bevelled, so as to form an extended V. This ensures the plastic rubber

entirely filling the hole. The part to be repaired is then well dressed with vulcanising flux, which is contained in the lead tube. When practically dry the

following procedure is followed: A piece of the plastic rubber, rather larger than the size of the cut or hole, is cut off, then a second piece a little larger still. These are placed in the china dish, and on them is poured a small quantity of vulcanising fluid, just sufficient to cover the plastic rubber, and here it should be allowed to remain not longer than eight or ten seconds.

The plastic rubber is then removed from the dish, and when the moisture has evaporated the smaller piece is pushed into the hole, and immediately the larger piece is placed over it. The tube is next put into the small press, and should be well screwed down. After about five minutes it may be removed from the press, and after the tube has been exposed to the air for a few minutes it has been permanently repaired. The repair should not be trimmed for at least six hours, but this is only necessary for appearance sake.

The same method can be employed for repairing a cut in an outer cover. In this case it is as well to allow ample time for the repair to set firmly. The whole outfit is contained in a neat and well made wooden box.

The Instanter vulcanising outfit, the method of operation of which is described on this page.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Central Office for Motor Machine Gun Service :

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

**N**EARLY a hundred recruits were enrolled in the ranks of the Heavy Section, Machine Gun Corps, last week, the men in every case being experienced car drivers or motor cyclists. The larger number presented themselves at Coventry on Tuesday, but there was quite a good number of candidates at Nottingham on Wednesday. After Tuesday's inspection the men were billeted in Coventry that evening, and proceeded to the training centre next morning.

We think it well to repeat, in view of the large number of applications which are being received, that men may only enlist for immediate service, and that letters need not be written at all, provided the particulars on this page are noted and applicants attend one or other of the inspections arranged.

## This and Next Week's Arrangements.

This week Mr. Geoffrey Smith, Editor *The Motor Cycle*, attended at Coventry Recruiting Office on Tuesday, the 9th inst., and will be at 20, Tudor Street, London, E.C., on Saturday afternoon next, the 13th inst., between 1.30 and 4.30 p.m.

Next week's arrangements are as follow :

COVENTRY.—Recruiting Office, Little Park Street, Tuesday, May 16th, 11 a.m. to 4.30 p.m.

MANCHESTER.—Iliffe and Sons Ltd., Century Buildings, 199, Deansgate, May 17th, 2 to 4 p.m.

The following are the particulars of enlistment in the Heavy Section, Machine Gun Corps :

Applicants must be experienced car drivers or motor cyclists, able to execute ordinary running repairs.

Pay, 1s. 2½d. per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limits, 19 to 40.

Applicants must be fit for General Service abroad, or for Garrison Duty abroad.

## Last Week's Recruits.

Ainsley, F. W., Durham.  
Angleleri, A., Hereford.  
Arnold, T. A., Newark.  
Baines, W. S. S., Broomhill.  
Baker, E. W., Dudley.

Williams, A., Cambridge.  
Williams, W., Rhos-on-Sea.  
Wilson, J. A., Crewe.

A fine batch of recruits, accepted by the Editor at Coventry on Tuesday of last week, for the Motor Machine Gun Service

## TIME TO LIGHT LAMPS.

GREENWICH TIME.

May 11th	...	8.5 p.m.
" 13th	...	8.9 "
" 15th	...	8.12 "
" 17th	...	8.15 "

### Enterprise.

We know one young and enterprising designer, in whose running shed one may see a different make of machine almost every week, and here's luck to him!

### Spring Frames and Rough Roads.

The road surfaces are getting worse and worse, and no improvement is to be expected till the war is over. Riding a spring frame Powerplus Indian over the week-end, we were fully able to appreciate its merits, and we have a spring frame mount on order.

### A New "Extravagance" Poster.

The latest effort by the National War Savings Committee begins as follows: "ARE YOU HELPING THE GERMANS? You ARE helping the Germans when you use a motor car for pleasure." We are happy to see that motor cycles are not included. It is almost too much to expect that this committee regards motor cycling as an economical method of travelling, but it certainly looks like it.

### A One-armed Motor Cyclist.

A rider, who is minus his right arm, was seen riding a Douglas in Coventry one day last week. Though the roads were greasy and the traffic heavy, he seemed quite happy, and had the machine apparently under excellent control. A foot-operated bell on the right side foot-board was used as a warning instrument.

### The Mono-wheel.

It has been stated in print that the secretary of the Auto Cycle Union in suggesting a wheel tax has omitted to consider the Auto-wheel, which, having three wheels, would be liable to a tax of £3 3s. We have never before been aware that an Auto-wheel had more than one wheel, nor were we aware that a tax could be demanded for a pedal cycle.

### Motor Cyclist Specials Wanted.

We are requested to state that vacancies exist for motor cyclists in the Metropolitan Special Constabulary, Transport Department. Men interested must be ineligible for the Army or Navy, and application should be made to Room 581, Scotland House, Embankment, Westminster. The service is entirely voluntary, but a small allowance is granted towards running expenses.

## SPECIAL FEATURES

THE FIRST THOUSAND. THE 6 H.P. P. AND M. ON THE ROAD.  
IRISH EASTER MONDAY TRIAL.

### Silence.

Some motor cycles are still far too noisy. Many of the heavy sidecar combinations, which have plenty of room for a spacious silencer, are inadequately equipped in this respect, and the police seem keener on speed than silence, in the London area at any rate.

### The Further Restriction of Imports.

An additional list of prohibited imports has been officially announced, which includes rubber tyres and tubes for motor-cars and motor cycles.

### The Portsmouth and Southampton Roads.

The Portsmouth Road as far as Guildford is in a condition which may be described as fair to good. The Hog's Back, towards Farnham especially, is very rough, but steam rollers are at work on it at two places. The repairs are being carried out with Tarmac. There is plenty of tar about just now, and, as usual, the top dressing being meagre, it flies up all over the machine. The police trap from the cemetery to the horse trough in Kingston Vale was busy on Saturday last. It was amusing to see the uniformed man trying to flatten himself out against a doorway.

### A Transvaal Race.

We are informed that a road race from Volkhurst to Vakkerstroom and back, a distance of thirty-six miles, was won by a rider mounted on a 1913 model 3½ h.p. Rudge. The roads were in a very bad state owing to heavy rains, and most competitors suffered from slipping belts.

### Artist and Motor Cyclist.

One of the most favourably criticised pictures now being shown at the Goupil Gallery, 5, Regent Street, in aid of the Star and Garter Building Fund, is one, by Mr. Eric Kennington entitled "Kensingtons at Laventie." Mr. Eric Kennington's work will not be unknown to our early readers, as he ably illustrated a series of stories which appeared in *The Motor Cycle* in 1905. His favourite means of locomotion is an Auto-wheel, and it is interesting to note that he served at the Front with the regiment the incident concerning which his brush records. His father is a well-known artist, and his brother a clever electrical engineer, a keen motor cyclist, and now one of the leading technical experts with the Remy Electrical Co., the American motor cycle lighting and ignition specialists.

ROAD RACING IN SPAIN.

R. Escala (6 h.p. Enfield sidecar), winner of the sidecar class in the Carrera Cup trial, held in the neighbourhood of Barcelona over a distance of seventy miles one day last month. Second and third places were secured by Motosacoche and Indian riders respectively.

**Daylight Saving.**

Daylight Saving, which is to come into force on Sunday, the 21st, will be welcomed heartily by all road users, especially in these days of lighting restrictions.

**Troops on the Road at Night.**

Several regrettable accidents have occurred, since the commencement of the war, through vehicles running into troops on the march at night. We understand that the Army Council has recently issued instructions to the effect that troops marching along roads at night will invariably be preceded by an advanced party carrying a white light, and followed by a rear party carrying a red light.

**The Trial in the Peak District.**

We have been asked to state that the Sheffield and Hallamshire M.C.C. had no connection with the above trial, which was held on Easter Monday, and we are further informed that, while the trial was advertised as an "open competition," no permit had, in fact, been obtained from the A.C.U., which made it impossible for many well-known riders of the Sheffield district to compete, even if they had wished to do so. The account published by *The Motor Cycle* made it quite clear that the trial was privately organised.

**Imports and Exports.**

A further decrease in the numbers of motor cycles imported is to be noted, though the value of parts has gone up considerably according to the latest Board of Trade returns, which are for the month of April. Exports, we are sorry to note, show a considerable drop both as compared with the previous month and the same month of last year. However, it is to be hoped that this is only temporary. The returns as applied to the whole trade of the country are satisfactory, in that exports show a very appreciable increase and imports a small increase.

The actual figures for motor cycles are :

**IMPORTS.**

	April, 1916.	March, 1916.	April, 1915.
Number .....	349	378	476
Value, complete machines	£14,279	£4,209	£25,619
Value, tyres and parts ..	£17,810	£10,321	£13,535

**EXPORTS.**

	April, 1916.	March, 1916.	April, 1915.
Number .....	626	1,093	942
Value, complete machines	£29,487	£49,305	£40,298
Value, tyres and parts ..	£24,105	£30,613	£31,074

**Motorists and Taxation.**

The A.A. and M.U. has received a great number of protests against the proposed new taxes from motorists resident in all parts of the United Kingdom. In the main these protests emanate from the professional and business classes, such as surveyors, doctors, clergymen, farmers, commercial travellers, veterinary surgeons, etc., and it is clear that if the present proposals are passed into law they will operate harshly against men of moderate means and the owners of cars used for utilitarian purposes. The A.A. and M.U. has already approached the Chancellor of the Exchequer, and recommended (a) reduction of the tax on the 16-26 h.p. class, (b) relief for old cars, (c) abatement or exemption where cars are used for public work, and (d) modification of the proposed taxes on motor

cycles and the rejection of the horsepower basis for this class of vehicle. The proposed abrogation of the licences already issued is also being carefully considered by the Association. These licences indicate that, having paid the amount stated, the person in question is entitled to use his car or motor cycle up to December 31st, 1916, without further payment. It is clear that many motorists only paid this duty on the assumption that the terms of the licence would be adhered to by the Government, and that by such payment they were guaranteed the use of their cars for the whole year without further duty being imposed.

**Racing in the Argentine.**

A 100 kilometre race for the Argentine Championship was run off at Buenos Ayres some few weeks ago. The course was a flat, oval, dirt track, of which sixty-one laps were required to make up the 100 kilometres. First place was secured by the rider of a four-cylinder Henderson (time 73m. 16s.); second and third places were taken by Indian riders.

**Twist-handle Controls.**

Those who drive all kinds of machines are in a better position to judge as to the best methods of control than the designer who drives his own machines only. Changing as we do from British to American and American to British, we cannot speak too highly of the Bowden lever, which is less tiring to operate, and it is easy to see whether it is shut or open. Last autumn we rode an American four-cylinder fitted with Bowden levers, and the result was splendid. When they are allowed to import again, American makers should pay more attention to British tastes.

**Easy Starting.**

We referred recently to the number of queries we were receiving on the subject of difficult starting. We find just the same trouble ourselves on machines which come our way for trial, and makers might well give this matter more careful attention. So far the easiest machine to start which we have yet come across is the vibrationless and ever handy Douglas. In fact, all horizontally-opposed twins are notoriously easy starters.

**Another Wounded Soldiers' Outing.**

It is proposed to hold another outing for wounded soldiers similar to that which was so successfully carried out in February last. All riders of Harley-Davidson motor bicycles are asked to co-operate. It is proposed to pick up the men from St. Thomas's Hospital at noon on Saturday, May 20th, and to take them down to a destination which will be announced later, where they will be entertained by artists in a similar manner to the last occasion, which was so successful and so heartily appreciated.

**A Munition Workers' Paperchase.**

Messrs. Burney and Blackburne recently organised a pedal cycle paper chase for their employees, which was a great success. In the event motor cycles played quite a conspicuous part, several of the directors being mounted on Blackburnes, while the trail was laid by that well-known competition rider, J. S. Holroyd, who, at the termination of the proceedings, won a 500 yards scratch cycle race. Our older readers will remember how much pedalling practice he used to get when he rode the old-time lightweights.

TYPICAL FRENCH DESPATCH RIDERS AND THEIR MOUNTS.

From left to right : Auschitzky (Clément), Lamanry (Triumph), and Delavière (Rover). The steel helmets and the generally smart appearance presented by the men will be noted. M. Auschitzky, whom we have to thank for the photograph speaks very highly of the running of the machines illustrated.

## WOUNDED SOLDIERS' OUTING IN SCOTLAND:

**M**EMBERS of the Dundee Motor Cycle Club are to be congratulated upon the success attending the outing they arranged for wounded soldiers early last week. The principal factors that made it so successful were the fine weather, the excellent response of owners of sidecar outfits, and the energy displayed by Messrs. Myles and David Mann in the arranging of the programme.

Sixty-two wounded men were picked up at midday at the Eastern War Hospital, Dundee. The route followed was *via* Birkhill and Coupar Angus to the wooded hills of Binham and Dunkeld. At the latter place the Scottish Horse had placed a suitable field at the disposal of the club, and here tea and a smoke were enjoyed before resuming the homeward run.

1. General view of the tea

2. The organiser's party. 3. Some of the guests enjoying a sun bath. 4. After tea. 5. Mr. I.

## SIXTY-TWO HEROES IN SIDECARS.

It is hardly necessary to add that the soldiers enjoyed the outing immensely, and already plans, we are informed, are in preparation for a second trip in the near future.

Quite a feature of the outing was the interest displayed by the riders in the large fleet of sidecar outfits that were seen to best advantage at the tea stop. Naturally with sixty-two machines together it was a good opportunity for inspection and comparison, and the delight of the owners of the newer machines was interesting to see. Most of the well-known makes were represented, Enfields and A.J.S.'s being in the majority. The only lady rider was mounted on an 8 h.p. Enfield. There was only one cycle car—the Humberette that occupies a prominent position in the centre photograph.

the number of sidecars will be noted.

camera and a smoke.

ann, organiser of the event, takes a soldier in his sidecar, likewise Mr. Myles (No. 6).

## ENCLOSED OR OPEN CHAINS.

### The Pros and Cons of the Two Systems.

**T**HOUGH most experienced riders are strongly in favour of the enclosed chain drive, there is no doubt that a good deal still remains to be said in favour of the open drive from countershaft to rear wheel. In order to warrant its existence a chain case needs to be made on very substantial lines, with as few overlapping joints as possible, and it should consist, as far as possible, of solid aluminium castings with good wide joints and ample provision in the way of anchorage.

There is no question that the properly enclosed chain drive is ideal, and its one "fault" lies with the motor cycling public, not with the system itself. With this system a broken chain is a very rare occurrence; one will probably ride two or three seasons without experiencing such a thing, but if, finally, it does occur, the open chain advocate at once points an enthusiastic finger and exclaims, "I told you so!"—A single instance of a broken chain and a damaged gear case is sufficient to prejudice the motor cycling community of a given locality for at least a year, and therefore if disaster of this kind can be rendered less likely by the use of specially heavy chains, then this extra strength is certainly a property to be desired.

Personally, I have experienced no transmission troubles of any kind in 15,000 miles riding with enclosed chain drive, but this is probably because I occasionally look inside the chain case. It is quite conceivable that a large number of riders, using machines of this description, are likely to forget all about their transmission system for months on end, and in such cases of neglect the time may come when one of the chains develops a weakness and finally breaks, with the usual sad results.

#### Periodical Inspection.

Many manufacturers have adopted the enclosed chain drive for one or another of their models, but riders must not imagine that, because the chains are enclosed, it is approaching a criminal offence to look inside. The chains should be carefully inspected every 3,000 miles after the initial slack has been taken

up, and the inside of the chain cases should be cleaned out if necessary. If this is done, nothing cheaper and better than the enclosed chain drive can be arrived at, but large inspection ports are certainly necessary.

If chains are not totally enclosed, they must either be kept in good condition or renewed periodically. The chain case, however desirable it may be, can only be regarded as an extra fitment which is susceptible to damage, and the rider who is willing to keep his chains in good condition will probably find no cause for complaint against the open rear chain. The business of looking after it is its most objectionable feature, and a great many riders make the mistake of keeping their

chains covered with oil or grease. The "wet" dressing simply accumulates grit, which destroys the wearing qualities of the chain. Open chains should be kept well lubricated but as dry as possible. This is easily effected by boiling the chain periodically in really stiff grease, containing plenty of graphite, and by allowing all the superficial grease to drain off before the chain is restored. It is quite a fallacy that any harm can be done to the material of a chain by boiling it; the tempering temperature of metal is so high that any kind of lubricant would vaporise and burn long before it was reached.

For colonial use the open rear chain is unquestionably the thing. Chain cases are apt to become damaged on the extremely rough roads that exist in most pioneer lands. The engine and the transmission need to be well up, and there should be nothing about the lower portion of the machine that can interfere with the drive by becoming dented or damaged. Even the cases from the engine sprocket to the countershaft should be well up and out of harm's way. In British Columbia I often rode with a priest, who used a British-made motor cycle, and the countershaft chain case was the cause of so much trouble that finally we committed it to a watery grave.

Moreover, the extreme strains to which the transmission of a machine is often subjected in the Colonies makes one nervous as to the welfare of the chains unless they are visible and instantly accessible. H.M.B.

Examples of enclosed and open chain drives.

## MOTORING IN BRAZIL.

WE have been glancing through copies of *Auto-Propulsao* of Rio de Janeiro, and it is good to know that Brazilian automobilism in all its branches is nourished by a real live technical paper. *Auto-Propulsao* covers motoring, motor cycling, aviation, and motor boating, and though it has only been in existence a little over twelve months, it is making good headway.

In suggesting an exchange with *The Motor Cycle*, the editor of our contemporary writes: "There is not doubt that you is not going to get a great profit with the exchange of your authoritative big magazine, with our modest publication, as a child having nothing good to offer his father."

The Metropolitan Machinists' Co. make a feature of Watsonian sidecars, which they have in all weights from 47 lb. upwards, suitable for lightweight motor bicycles. They also sell twelve different patterns of motor cycle handle-bars to suit all tastes, and give special attention to providing hoods and windscreens for sidecars.

It is interesting to have to record that the Metropolitan Machinists' Co. is one of the few firms which supply petrol in the City of London.

### Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable
A.B.C.	1915	3½ 4-speed	—	£63
A.J.S.	1915	6 3-sp. sidecar	—	£92

## THE 2½ h.p. LIGHTWEIGHT JUNO.

## Two-stroke Villiers Engine. Single and Two-speed Models.

RECENTLY we had an opportunity of inspecting the latest model 2½ h.p. Juno at the premises of the Metropolitan Machinists' Co., 248, Bishopsgate, E.C. Its motive power is a 2½ h.p. Villiers two-stroke engine, and the drive is by the usual combined chain and belt to the back wheel. An Albion two-speed gear box is fitted. Lubrication is effected by means of a Best and Lloyd sight drip feed, from which the oil drips by gravity to the induction pipe. We also noticed another model in which the oil is led direct to the crank case. We were pleased to remark the large size of the filler caps on the tank.

The machine is well equipped, having a separate spark control and Brooks B150 saddle, a good luggage carrier, and also a metal cased toolbag. The same type of machine is sold with single speed. Yet another model Juno is the 6 h.p. J.A.P.-engined twin, with combined chain and belt drive and three-speed countershaft gear; it is especially suitable for sidecar work.

The 2½ h.p. two-stroke two-speed Juno.

The left-hand view is that of the flywheel side of the power unit. (See description above.)

### Paraffin as a Fuel.

Sir,—I have read your correspondence and "Questions and Replies" about running on paraffin. This subject interests me very much, as I am doing a lot of riding on burning paraffin without any petrol added. The Excelsior Co. made me an engine (5.6 h.p. single) with a low compression, and fitted up the machine with a three-jet Binks and tank divided to hold six pints of petrol at the back, one and a quarter gallons of paraffin in the middle, and a quart of oil at the front. I have just completed 1,000 miles, and find that I can get more miles out of paraffin, but not so much power. I am getting some Binks fuel to try, but it has not yet arrived.

If it had not been for paraffin I should have had to put the machine by. It takes very little petrol to get the machine warm, and both taps are near the saddle; it is no bother to switch off to paraffin. Of course, up hills I turn on the petrol. I am running a big coachbuilt sidecar; my passenger and I weigh twenty-two stone. I had the valve caps off the other day, and found all cleaner by far than I expected, and shall not decarbonise for at least another 1,000 miles. I am also using Spots in both spirits.

JOHN S. ROBSON.

### Top Feed Carburetters.

Sir,—This matter seems to be causing some attention, and, as far as I am able to judge, the bottom feed is superior in many respects, and, taken all round, is the more desirable form.

I notice in a letter from Messrs. Brown and Barlow that they are comparing the top feed with the bottom feed with *toggle mechanism*. Toggle mechanism is quite unnecessary and a positive disadvantage in a motor cycle carburetter, whereas float chambers constructed like the Amac and our own are freed from all these complications. It is not necessary to have top feed in order to abolish the objectionable toggle mechanism. A disadvantage of top feed is the screwing on of the lid. Large diameter threads are bad to start, and are constantly getting put in cross-threaded, and when a float chamber has to be cleaned out the petrol pipe has to be disconnected and the lid screwed off, and it is difficult to unscrew one without unscrewing the other, and so on, and the life of the needle comparing the top feed and the bottom without toggle mechanism is identical, and any dirt coming through the top feed has to filter through the petrol, and stands a much better chance of being drawn into the jets, choking them up.

The top feed arrangement was tried in very considerable quantities years ago, and found wanting.

Messrs. Brown and Barlow state that an advantage of the top feed is that, when the carburetter is flooded, the petrol level in the float chamber is not raised, and that the flood is over immediately the tickler is released. I am afraid I cannot follow this at all, as when the float is pushed down by the tickler the needle is also pushed off its seat and the petrol pours in from the top, and consequently the level must be raised.

Nearly the whole of the troubles in connection with flooded carburetters are caused by the lack of a proper filter between the tank and the float chamber, as fluff in the petrol prevents the needle closing on its seat.

C. BINKS, LTD.

## LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Sir,—I have read with much interest the various letters which have appeared in your paper from time to time regarding top feed carburetters.

Twelve of the machines under my charge are fitted with this type of carburetter, and we have found them efficient in every way. With regard to wearing qualities, these machines have now been running for twelve months on active service in England, and the total cost of repairs for these twelve carburetters consists of one new float. I think a repair bill of a few shillings for a grand total of over 80,000 miles (chiefly over bad roads) speaks for itself.

We never find trouble when it is necessary to examine interior of float chamber. Union under tank and clip under mixing chamber are unscrewed, and float chamber and jet come away for inspection. What could be easier or quicker?

I have met riders who have suffered from choked carburetters when a small gauze has been fitted in the float chamber lid. In every case I have effected a cure by removing this gauze and fitting a combined filter and tap. (Best and Lloyd) in place of the usual petrol tap.

I have had experience with all types of carburetters, and am of opinion that the top feed will take some beating.

MOTOR CYCLIST SERGEANT.

### Four-cylinder Motor Cycles.

Sir,—It was with great interest that I read Mr. Thompson's letter *re* the four-cylinder F.N. I should be greatly obliged if he could find time to give a more detailed description of the alterations he has made.

I ride a 1913 two-speed four-cylinder F.N. myself, and consider that, with one or two alterations, it would be quite the best proposition of the day for size and weight and power.

Mr. C. H. Vowels, in a letter in your last issue, demands plugs in the centre of the cylinder head, but, according to my experience, it is purely a matter of luck which position suits the plug best.

A single-cylinder 4 h.p. J.A.P. which I had was fitted with plugs over inlet, and also in the place of compression tap. By changing the h.t. wire from the *centre plug* to the one *over the inlet valve* a most marked difference in running was noticed, the engine accelerating as if the throttle had been opened. A similar test with another engine of a different make resulted in no difference of either power or speed.

The chief fault of the F.N. I consider to be the oiling system, which is wasteful, besides putting oil where it is not wanted, causing the valves to stick in the guides when starting from cold.

The mechanical inlet operation would certainly give more power at slow speeds and an easier start from cold, but I consider that well-adjusted automatics will give *almost* equal results, with the advantage of fewer working parts (difficult to oil), and with four points less for air leakage.

I am, nevertheless, interested in Mr. Thompson's statement that he has a four-cylinder F.N. with mechanical inlets of his own design, and would very much like to know exactly how it was carried out.

C. FREEMAN.

### Carbonisation.

Sir,—Many of your readers must have been conscious of a feeling of envy when reading in your paper that some of your correspondents are able to defer the messy operation of decarbonising their cylinders until they have run over 5,000 miles. I am one of those less fortunate ones, who have, so far, found it necessary to decarbonise after each 500 miles. I drive a well-known twin-cylinder combination with

mechanical lubrication, and some experiments I carried out lately seem to throw considerable light on this question of carbonisation, and may be of interest to your readers.

Needless to say, I have tried more than one brand of lubricating oil for air-cooled engines. I used to endeavour to get easy starting by using an oil of medium body, but soon found that such an oil was liable to produce rather more carbon than a heavier oil. After use such an oil drawn off from the crank case was found to be black in colour, very thick when cold, but thin and watery when hot. Its flash point had undergone a drop of 28° from 208° C. (that of the original oil) to 180° C.

It is obvious that the lubricating oil had undergone "cracking" in the cylinder, with deposition of carbon and formation of substances of lower flash point.

Two of the main factors which influence the "cracking" of mineral oils are present to a varying degree in all internal combustion engines, viz., (a) high pressure and (b) high temperature. Both of these factors are variable in motor cycle engines, and any condition which tends to increase them will increase the amount of carbon deposited. For example, the more the throttle is opened (with consequent increase of speed) the greater will be the average internal pressure. Overloading the engine, using too high a gear, and use of too big a jet would all tend to raise the average temperature of the cylinders.

To maintain clean cylinders the following conclusions seem fairly obvious:

1. Do not use too large a jet.
2. Do not use too high a gear.
3. Do not overload a sidecar combination, nor drive at too great a speed.
4. Do not delay changing down on hills.
5. Use as heavy a lubricating oil as is practicable.
6. Provided ignition and timing are in order, do not worry about easy starting.
7. Maintain cylinders as cool as possible.

Condition 3 is stated broadly, as different machines will vary a lot in their capacity for speed, and in what constitutes overloading.

These conclusions suggest that a low compression, efficiently cooled engine should maintain the cleanest cylinders, other conditions being equal.

I should be interested to hear the opinions of others, who have given any thought to the "reasons why" of carbonisation.

THOMAS A. DAVIDSON.

### An Efficiency Formula.

Sir,—With reference to the question of hill-climbing formulae, it has occurred to me that the general use of a simple formula which would enable any rider to test the efficiency of his engine would be of some service to motor cyclists.

In competition work the time element is an important item in deciding the winner, but the average tourist, so long as he can climb a hill with certainty, does not attach much importance to m.p.h.—in fact, generally prefers to climb at a moderate pace.

Leaving out, then, the time taken, the factors to be taken into consideration are: Capacity of cylinders, total weight, gear ratio, and gradient. The efficiency will be:

$$\frac{\text{Capacity} \times \text{gear ratio} \times \text{gradient}}{\text{Weight}}$$

For example, a 1,000 c.c. engine geared 6 to 1 may be found to pull a total weight of 800 lb. up a gradient of 1 in 8. In this instance the efficiency is:

$$\frac{1,000 \times 6 \times 8}{800} \text{ i.e., } 60.$$

Should the owner be dissatisfied with this result and tune his machine to surmount a gradient of 1 in 6, he will have increased the efficiency to 45 and will be correspondingly gratified.

This method of determining the efficiency of an engine would enable a comparison to be made of different machines without bringing them into actual competition, and the test can be carried out on any hill the gradient of which is known.

It would be a distinct advantage to the seller of a second-hand machine to be able to guarantee a good efficiency rating.

A reversal of the formula will be very useful in enabling the prospective tourist to form a fairly exact estimate of

how his machine will behave under hitherto untried conditions. The gradient climbable will be:

$$\frac{\text{Weight in pounds} \times \text{ascertained efficiency}}{\text{Capacity in c.c.} \times \text{gear ratio.}}$$

Say a 900 c.c. twin, total weight 600 lb., with an efficiency of 50. This will climb a gradient of:

$$\frac{600 \times 50}{900 \times 6} = 5\frac{5}{6}$$

or, roughly, 1 in 6. If the contour book shows that steeper inclines will be met with, gear will have to be lowered or weight discarded.

As a general rule, when the actual efficiency has not been ascertained, it may be assumed that a machine in good tune will climb a gradient of

$$\frac{W \times 50}{\text{One in } \frac{\text{Capacity} \times \text{gear ratio}}{50}}$$

This should be of use to intending tourists.

R. H. CHURLEY.

### Motor Cycle Taxation.

Sir.—It would be ungracious for any motorist to allow *The Motor Cycle's* efforts in regard to the proposed tax to pass unheeded. Thousands of us gave up pleasure motor cycling, when called upon, that petrol might be saved. We used our machines for business or professional purposes only. Then the tax was doubled. The answer many must give is the abandonment of a useful servant, and consequent loss of petrol tax as well as machine tax. The editor has proposed a reasonable solution, and I hope it will be adopted.

A.B., 23.

Sir,—Regarding the proposed extra tax on motors, I am writing you as a lady sidecarist to whom motoring means not only pleasure but renewed health and vigour. I want to offer a suggestion. It may not be new, or feasible, but at any rate the mere fact of writing it may relieve my feelings, which are more than hot, on the matter. Could not a list be compiled showing the sum total of motors which will have to be given up if the tax comes into force, and which will also give the amount of money the Government will lose by imposing the tax? I would gladly send not only my own name, but all the names of persons in this district so affected. Is it not rather mean to get our hard-earned guinea for the year before letting us know we should be taxed to this proposed outrageous extent? If we have to give up the motor (and there seems nothing else for it), we lose nearly four months' pleasure out of the twelve months paid for (we usually motor through the winter). Having myself a tendency to consumption, I am obliged to avoid all pleasure that means contaminated or vitiated atmosphere of any kind. Since I have been out in the fresh air I have found great improvement in my health, both physical and mental. If the motor goes I shall have to keep to the house altogether, as I cannot walk far without exhaustion. I manage to do all my own housework, bake my own bread and economise, and stint myself in clothes so as to be able to afford the motor at all, and it "goes against the grain" to have to give it up. Our income has gone down owing to the war, and the cost of living has gone up by leaps and bounds since we got our beautiful new 6 h.p. Enfield last August.

I cannot help thinking that if motorists would band together and get the matter properly represented at "head-quarters," something might be done. Why is there no tax on ordinary cycles? One-third of our local mechanic's time is taken up with repairs to ordinary push-cycles, and most of the riders could pay at least a small tax. This surely would lessen somewhat the need for such drastic treatment of motorists.

I was trying to muster up courage to tackle driving the machine myself, as my husband can only take me out on Wednesday afternoons and Sundays, but I hardly think it worth while to begin now. We shall either have to sell the machine at a great loss, or else garage it till better days come. We cannot possibly find the extra tax.

We have taken your paper now for over two years, and I always read everything (except the purely technical parts) with great interest.

Apologising for this lengthy effusion,

ETHEL M. WILLOUGHBY.

# QUESTIONS AND REPLIES

## Gear for Sidecarring.

**?** (1.) What is the proper gear ratio for running my machine with sidecar attached to get the maximum speed with minimum wear and tear on engine? (2.) How do you find the proper gear ratio? (3.) What will be the new tax on my  $3\frac{1}{2}$  h.p. three-speed 1913 Triumph?—D.L.C.

(1.) You should use as high a gear as possible without causing the machine to labour. You will probably find this will be about 5—1. (2.) To find what the gear is you count the number of times the engine revolves to one turn of the rear wheel. (3.) The tax on your machine will be £3 3s.

## † Making a Starting Device.

**?** My  $3\frac{1}{2}$  h.p. Rover sidecar is fitted with an Armstrong Mark III. three-speed hub, and, as you know, I cannot start the engine without putting the machine on the stand. Is it practicable to fit a free wheel on the outer flange of the adjustable pulley, and then reverse the pedalling gear to bring the chain wheel on the same side of the machine? I could get a larger chain wheel if necessary, and bring the gear to, say, fifty-six (or even larger) teeth on the large wheel and sixteen teeth on the free wheel. Perhaps you can make some suggestion, if you do not think the above idea any good. Would you recommend fitting a decompressor to assist in starting—if so, what pattern? I rather like the type which lowers the compression by means of an auxiliary chamber and has no outlet to the air. Do you think I could make the machine start slower by fixing up some arrangement to control the bottom air (B. and B. carburettor, 1912) and then giving less throttle opening? It draws a lot of bottom air, as I seldom have the air lever wider open than the throttle, even when going fast.—W.T.M.

It is quite possible to fix up a starting device such as you suggest, and we have seen it carried out with more or less success several times, but the free wheel is in action the whole time the engine is running, and is, therefore, called upon to perform very heavy work. Owing to the speed of the engine this rapidly wears out, and requires frequent injections of oil to keep it free at all. If you could devise some system incorporating a free wheel which could be disengaged from

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

the engine-shaft after the engine has been started it would be more satisfactory. A decompressor would probably assist you in starting. There are several perfectly satisfactory auxiliary fittings on the market, and we favour the pattern with the double-seated valve. Your carburettor is evidently not adjusted properly. Possibly there is an air leak between the carburettor and engine, or the choke tube may be too large. Either of these may prevent you getting a sufficiently rich mixture for starting easily. Bind all doubtful points between the carburettor and engine with adhesive tape.

## Testing the Compression.

**?** How can I ascertain whether I have good enough compression on a 6 h.p. twin Enfield, as on this machine there are no pedals?—R.W.S.

If the compression will skid the back wheel when pushed along with the valve dropped your compression is sufficiently good for ordinary purposes.

## Engine Choking.

**?** My machine is fitted with a  $2\frac{1}{2}$  h.p. M.A.G. engine, and has a fixed-jet carburettor. Whenever it is necessary to run for any length of time on three-quarters throttle it suddenly misfires and comes to a standstill. Except when starting, the air lever must always be kept open, otherwise the engine misfires. What is the matter with the machine? Is it too large a jet?—H.S.

It certainly does look as if the jet were rather too large. The stoppage might quite well be due to choking, caused by too strong a mixture. Try fitting a smaller jet.

## A Motor Cycle for Business Purposes.

**?** I am thinking of purchasing a motor cycle and sidecar, which I intend to use as a means of conveyance of tools and materials in connection with my business. It will be used by me and my employees, and may sometimes be required to be driven solo on errands. Shall I have to pay any taxation provided my name and address are painted on the sidecar?—W.G.H.

You will not have to pay any local taxation licence provided the box body is always kept on the machine. If you use it for solo purposes the authorities will argue that when the box is detached it is quite possible to use it for pleasure riding; and then you will get no exemption, nor would you if an ordinary passenger body were fitted.

## Converting a Lubricator.

**?** I have connected the auxiliary oil pump of my mount up to my drip feed, as I did not find the latter satisfactory, but now I find I cannot force the oil through with a reasonably strong spring. I might mention that my pump has two valves, so that a tap is not necessary. My machine is a 1913  $2\frac{3}{4}$  h.p. Enfield. Could you tell me the best thing to do? The engine also gets very hot. Is there any cure for it? Everything is in perfect order. Should I advance the magneto timing? How much oil ought I to use? I live in a very hilly district.—H.G.B.

We should think there must be something choking the feed pipe, otherwise there is no reason why the oil should not be forced through the drip feed. Make sure the springs of the ball valves are not too strong. The most usual causes of overheating are insufficiently strong valve springs, too large a jet, stopped-up air supply to carburettor, choked silencer outlet, and ignition insufficiently advanced. Do not alter the ignition timing unless you are sure the engine would stand more advance. About the correct ignition timing would be with the piston on top dead centre the contact points should be just breaking with the ignition fully retarded. The little cardan shaft on this machine which drives the magneto is very apt to wear the base on the magneto spindle, and gradually to retard the ignition, when overheating is almost certain to result.

## PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

**Water in the Carburetter.**

**Q.** Will you kindly tell me what is wrong with my  $3\frac{1}{2}$  h.p. single-cylinder machine? Not having used it since Christmas I got it out and injected a little petrol in the engine, and after a lot of pushing it started and then stopped after going about fifty yards. Several times it did that, and once the silencer caught fire, but happily no damage was done. I was rather puzzled, so I took the carburetter down and cleaned it, and found three drops of water in the bottom. The machine acted just the same after I had put it on again. I might say the magneto is all right, as it was seen to before starting and a little adjustment made. Being rather a novice I hardly know what to do. Would it be advisable to get a new carburetter, as I think mine is a rather old one? I shall be very glad if you can give me a hint or two as to what to do.—E.W.

We think that the trouble is undoubtedly due to water in the carburetter. You may have succeeded in getting out what there was in the carburetter, but there is probably some still left in the tank. It will not mix with the petrol, but remains in globules at the bottom. Sometimes it gets into the petrol pipe, and finally into the carburetter. Water being transparent, if you hold up the jet to the light, even if there is water in it, it looks quite clear. All you can do is to persevere, and carefully clean every part of the petrol system, and we think that the trouble will cease. The reason why the machine runs for fifty yards and then stops is that it runs on the amount of petrol you

inject. The silencer catching fire was probably due to neat petrol being carried into the silencer, and fired by the next charge. A new carburetter seems hardly necessary. You might look to the contact breaker rocker arms, which may be stuck through the damp swelling the fibre bush. This frequently happens after a machine has been laid aside for some time.

**Timing for Touring.**

**Q.** My cycle is a  $3\frac{1}{2}$  h.p. single two-speed (Badcock's by-pass fitted). High gear, variable from about  $4\frac{1}{2}$  to 7 to 1; low from 9 to 14. I use it in very hilly country, with sidecar for a passenger who is unable to walk. So that power on hills is the essential requisite, and speed is not at all of importance. For that purpose (1) what timing of valves and magneto would be most suitable? (2.) If the total weight were 700 lb., what would be the maximum gradient surmountable? (3.) At what stage of wear should the facings of the drum clutches for high and low gear be renewed? I have been troubled sometimes with slip. The thickness now is about  $\frac{1}{16}$  in.—W.P.

(1.) Absolutely standard, viz., arrange exhaust valve to close when piston is on top dead centre; inlet to open immediately after. With sidecar, time spark to take place when piston is on top of the stroke with ignition half retarded. (2.) This depends upon the power developed by your individual engine. (3.) Do not trouble to replace these until clutch slip occurs. If the clutch slips and adjusting does no good, then it will be necessary to have new bands fitted.

**READER'S REPLY.****Refusal to Fire.**

"R.A." has perhaps timed his magneto so that the points open on the wrong segment. I have had that experience with my  $2\frac{3}{4}$  h.p. Douglas; everything seemed correct, but it refused to fire until the h.t. cables were crossed (i.e., each cable led to the opposite plug), then the firing was perfect. The trouble had been that the points had been timed to break on the wrong segment, therefore the spark was occurring on the top of the exhaust strokes instead of on the compression strokes. My h.t. cables are still crossed.—W. HANCOCK.

**DOING HIS BIT!**

The three-year-old boy of a Sidmouth motor engineer who insists upon helping to carry on the business during his father's absence on war work. With a spanner nearly as large as himself, the little boy is attaching a lever to the brake pedal which he is unable to reach with his foot.

### An Epicyclic Countershaft Gear.

By the mechanism illustrated there is provided a free engine and a two-speed gear, the lower ratio of which is afforded by an epicyclic train. In the casing A

are mounted two co-axial shafts B C. The inner ends of the shafts B C are respectively externally and internally coned as shown at D, and together constitute a conical friction clutch. On the shaft B is fixed a sun pinion F, whilst planet pinions G are mounted on pins carried by the driven shaft C. The internally-toothed ring H, which completes the train, is carried by an annulus J, which carries a chain sprocket, whereby it is driven from the engine sprocket K. The annulus is loosely mounted on the shaft B, the

outer end of which also carries a brake drum K, whereby it may be, either released or held against rotation as desired. In order to give effect to the cone clutch D, lateral motion must be imparted to the shaft B, and the mechanism for providing this is shown in the smaller view. It will be seen that the brake actuating mechanism is carried on a pivoted arm L, movement of which is

effected by a screw-threaded rod M, operated by the control lever N. With the parts in the position shown, the clutch D is engaged and the brake band free, so that a direct drive results. By moving the control lever N, the shaft B is partially withdrawn, and the brake band and shaft B held stationary, so that a reduced drive passes to the shaft C through the planet pinions. On further movement of the lever N, the shaft B is completely disengaged and the brake band released, so that no drive is transmitted to the shaft C, the engine running free. A kick-starter is provided in the form of a toothed sector O actuating a pinion P on the shaft B through a one-way clutch.—G. T. Dallison, No. 22,968, 1914.

### A Light Valve.

The importance of lightness in engine valves is not sufficiently recognised by many designers. Considering the high speeds at which motor cycle engines run, particularly for competition purposes, more importance should often be attached to reducing the weight of

these reciprocating parts, the inertia of which frequently becomes the limiting factor to the speed of the engine. As a rule, motor cycle valves are heavier than those on car engines, chiefly, of course, because they require to be made stronger. In this case the required strength is obtained by using a large conical neck between the head and the stem, and this is bored out for the sake of lightness, and the passage closed up at the top by a steel disc. The edges of the hole are spun over this disc, and the joint finally welded, after which the valve is machined all over, so that it has the appearance of a solid valve.—H. Lindley, No. 5,721, 1915.

We are informed that A. Blake, winner of the sidecar class and Wilkin trophy in the Sheffield Easter Monday trial, used a Henderson featherweight sidecar with his 2½ h.p. Levis.

Waverley Cars, Ltd., 115, Great Portland Street, W., have lately taken over the agency for the Edmund spring frame motor cycle, both wholesale and retail, for London and district, and also for the following countries: India, China, Federated Malay States, Ceylon, New Zealand, and Spain. They are in a position to give immediate delivery from stock, and will carry a large supply of spare parts for this machine.

### A Woman Tyre Representative.

The Steptey Tyre Co. is now represented in the South-west of England by Mrs. G. L. Hurrell, whose husband, before joining the Army, occupied the post.

### A Word for a Good Belt.

A reader wishes to place on record the satisfactory service he is getting from a 1½ in. John Bull belt on a 6-7 h.p. Zenith sidecar. The belt, he tells us, has been used for 7,000 miles, and still appears in excellent condition.

### Reviews.

"Cyclist Companies with Divisional Mounted Troops, 1916." Major J. C. Burnett, D.S.O., Chief Instructor Army Cyclist Corps. 1s. W. H. Smith and Son, 186, Strand, W.C. A book which every member of a cyclist battalion will find invaluable to him. What we should like to see is a similar publication for motor cyclists. There is no book which an embryo D.R. may read up before joining the Forces, and such a book is very badly wanted.

### A Good Machine.

There are few machines of which we have a more pleasant recollection than a 3½ h.p. Motosacoche twin, which was one of our mounts in the Isle of Man about two years ago. The silent running, excellent pulling properties, and reliability of this fascinating mount are not likely to be forgotten. Since that time the Motosacoche has greatly improved, and we are informed by the company that they can deliver promptly their 2½ h.p. single and 3½ h.p. and 6 h.p. twin models, while they carry a large stock of spares.

### Catalogues Received.

We have received from New Imperial Cycles, Ltd., Birmingham, a catalogue of the New Imperial Light Tourist model, which is now supplied with a clutch and enclosed kick starter in the case of both ladies' and gentlemen's machines.

We have also received from the same company a booklet entitled "Don't take Risks and Why," by Norman T. Downs, managing director of the company. It consists mainly of a series of press notices and testimonials relating to the New Imperial.

The New Hudson Cycle Co., Ltd., of Parade Mills, Birmingham, have sent us copies of the following booklets that they have just issued:

- "New Hudson Motor Cycles (Lightweights)—Hints to Riders."
- "New Hudson Motor Cycles (Lightweights)—Replacement Parts."
- "New Hudson Motor Cycles (Heavyweights)—Hints to Riders."
- "New Hudson Motor Cycles (Heavyweights)—Replacement Parts."

## MOTOR CYCLES FOR SALE.

## Auto-Wheels.

**AUTO-WHEEL**, 1914, new condition, ready to attach to motor cycle; £7.—P. J. Evans, John Bright St., Birmingham. [X9272]

**AUTO-WHEEL** De Luxe; £15/15, 28/3 monthly; converts any cycle to a motor.—Juno Showrooms, 248, Bishopsgate, London. [5156]

**AUTO-WHEEL** De Luxe, 1915 model, used station work 6 months, good condition; £9/10.—G.E.N., c/o Housekeeper, 222, Strand. [4988]

**AUTO-WHEEL**, fitted to B.S.A., 21in. frame, in good order, also spare new Dunlop cover; £11.—Heath, 1, North Cray Rd., Bexley. [5065]

**WALL** Auto-Wheel for sale, splendid condition, just overhauled by makers (£3); accept £10/10.—C. Street, Southampton St., Ringwood, Hants. [X9050]

**WALL** Auto-Wheel, 1914, latest type, single lever control, little used, cost £14/14, bargain, £8/10.—Murray, 37a, Charles St., Hatton Garden, Holborn. [X9161]

## Arno.

**ARNO** Motor Cycles from £38 to £50; early delivery; deferred terms from one-quarter down, balance by twelve monthly instalments. Clients purchasing motor cycles from us can practise on the private road and test hill alongside these premises before rejoining the West End traffic, this being the only London garage in the West End possessing this facility, and also being the only London garage that is totally bomb-proof. We garage Arno motor cycles for 1/- per week, and in the event of your being called to the colours, we will store same, pending your return, for the nominal sum of 1/- per month.—Messrs. Green Taxis, Villiers St. Garage, Charing Cross, London. [4055]

## Bat.

**1913** 8h.p. Bat-Jap and Sidecar, 2-speed countershaft, kick start, lamp, spares.—Smith, 6, Farnham Rd., Coventry. [X9292]

**BAT-J.A.P.** 1915 Combination, 6h.p. twin, Bosch, 2 speeds, countershaft, kick; £36/10.—1, Ebner St., Wandsworth. [X9146]

**1913** 6h.p. Bat-Jap, 2-speed countershaft, B. and B. Pilot, excellent condition; £32/10.—111, Grove Lane, Camberwell. [4949]

**1915** Bat-Jap and sidecar, T.T. handle-bars, speedometer, watch, and all tools, new last November; bargain, £60; 3-speed gate change.—35, Mile End Rd., London, E. [X9068]

**1914** Bat, chain-cum-belt drive, kick starter, 3-speed gear box, B. and K. sidecar, all spares and accessories; £60; any time.—172, Lordship Lane, East Dulwich. Tel.: 1201 Sydenham. [5069]

**BAT**, 1916, 4.5h.p. twin, 2-speed, T.T. sporting model, countershaft gear, brand new, in stock, £55, special price for cash only.—Elke and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0492]

**BAT-J.A.P.** 1915 5.6h.p. Combination, luxuriously sprung, 3-speed countershaft, Lucas fittings, Amal carburettor, fast machine, owner driven; cheap for cash sale.—Whitehouse, Engineer, Great Bridge. [X8294]

**BAT U** Crele, 6h.p., twin cyls., special model No. 2C, 1915 model, painted grey, Bosch ignition, countershaft gear with 3 speeds, complete with Lucas head and tail lamps, tyres 26x2½, spring footboards, Lucas horn, spare box, belts, and nuts, also spare chain parts, tools, pump.—Can be seen at Barkston Motor Co., 244, Earl's Court Rd., London, S.W. Price asked £75. [4874]

## Bown.

**BOWN-VILLIERS**, 1916 (brand new), 2½h.p., mag., 2 speeds, countershaft, very smart; list £38/10, price 29 gns.—Wandsworth Motor Exchange, Ebner St., Wandsworth Town Station. [X9149]

## Bradbury.

**BRADBURY**, 1913, 2 speeds, in good order; £18.—Percy and Co., 337, Euston Rd., London. [5177]

**BRADBURY**, 1912, and new coachbuilt sidecar; trial; £25.—29, St. Leonard's St., Bow, E. [5018]

**BRADBURY**, 4h.p., 2-speed, good condition; £30.—Prew, 3, Watcombe Terrace, Rowhaston, Taunton. [X9236]

**BRADBURY** and Sidecar, 1912-13, 2 speeds, 4h.p., smart turnout; £23.—Speechley, 45, Church Rd., Acton. [X9217a]

**BRADBURY** and Sidecar, splendid condition, everything; £35.—T. Holt, Brownhill Hotel, Heights Lane, Rochdale. [X9097]

**BRADBURY**, 1913, 4h.p., 2 speeds, clutch, chain drive, sidecar, accessories; quick sale £28-672, Commercial Rd., London, E. [X9146]

**BRADBURY**, 3½h.p., N.S.U. 2-speed gear, free engine, Amal carburettor, excellent condition; £20.—15, Woodcote Rd., Wallington, Surrey. [X9007]

**BRADBURY**, 4h.p., 1912, and wicker sidecar, engine just overhauled, 3-speed, good tyres and spares, £30.—Apply, Pinney, R.A. Mess, Woolwich. [X9072]

**BRADBURY**, 4h.p., practically new Palmer and Dunlop tyres, new piston, very fast, absolutely good condition; any trial; bargain, £25.—Clark, Long Medford, Suffolk. [5029]

**BRADBURY**, 3½h.p., 2 speeds, free engine, cane fold in chassis sidecar, fully equipped spares, and accessories, grand going order; £20, or near offer; must sell.—12, Swain Rd., Thornton Heath. [5163]

## CORONET Sidecar Chassis

Is designed for long life, and has a wonderful reserve of stability, and is safe on greasy roads. Luggage carrier built into frame. Cannot shake loose, and is a boon when touring.

£10 15s.

Send for Illustrated Catalogue describing these well-known Sidecars.

EXCHANGES.

TRADE SUPPLIED.

We can give immediate delivery of all models and suitable for any make of machine.

## SIDECARS FOR HARLEY-DAVIDSONS, EXCELSIORS, and INDIANS.

We make a special Sidecar, enamelled French grey to match, 28 x 3in. tyre, apron to cover entire body, and four-point attachment. . . . . £13 10  
Immediate Delivery.

## 7-9 h.p. HARLEY-DAVIDSON.

# JUNO MOTOR CYCLES ARE THE VERY BEST

Sergt.-Major J. BENNETT, Upavon, Wilts, writes under date 28/3/16:

"I am pleased in every way with my **JUNO V.T.S.** motor. It has given me not the slightest trouble the whole twelve months I have run it, approximately **10,000 miles**. The bearings are good as new, no shake anywhere, though the machine has done sidecar work for last eight months. It is and has always been the admiration of everyone who has seen and known it since I have had it."

This is only one of many testimonials as to the high quality of the "**JUNOS**."

**JUNO**, 2½ h.p., £29 10s., or £6 deposit and 41/8 month.

" 2-speed, £36, or £7 8s. deposit and 51/- month.

" V.T.S., £30 10s., or £6 4s. deposit and 43/- month.

" " 2-speed, £37, or £7 16s. deposit and 52/- month.

" 4 h.p., £62 15s., or £16 deposit and 83/4 month.

" 6 h.p., £75 12s., or £16 10s. deposit and 105/- month.

All carriage paid.

## SIDECARS.

**JUNO** Model A, £6 6s., or 11/8 month.

" Modèle de Luxe, £12 12s., or 23/2 month.

" Coach-built, £10 10s., or 19/3 month.

**WATSONIAN** Sidecars. A full range from £6 13s. 6d., or 12/3 month.

" The Tourist Model N, £11, or 20/2 month.

" Aero Model M, £12 2s., or 22/2 month.

Carriage paid.

At the moment of going to press, all above are on view in our Showrooms, but as stock is constantly changing, owing to demand, an early call is advisable. List free, 180 pp., which includes a most complete enumeration of Motor Cycle Accessories, Tyres, Belts, Clothing, Wind Screens, etc., at the very lowest prices. (See advt. in Miscellaneous Columns.) Any good make taken in part exchange for a **JUNO**.

## GODFREY'S

## THE VALUE OF A NAME.

*It is no unusual thing for Godfrey's to execute an order for an entirely new customer, living, perhaps, hundreds of miles from London, who is quite content to send his money for a machine selected from our list (and which he has not even seen), trusting to the reputation of the Firm to send him value for money.*

*He is perfectly safe in doing so, because every machine in Godfrey's Showrooms, whether new or second-hand (and irrespective of price) is most critically examined and tested before it is allowed to go out.*

*Godfrey's grudge neither the time nor the money spent in making their machines perfect in every detail, because Godfrey's expect every machine they sell to advertise their business.*

*They want YOUR machine to be better in every way than that of your friends. They want this and strive for this, for the credit and profit of the House; because they not only want to satisfy YOU, but they want your friends' custom as well as your own.*

*Call and inspect our Stock, or write for full Lists of New and Second-hand Motor Cycles and Light Cars.*

## A Scrap of Paper? Another Aspect of the Motor Cycle Taxation Question.

SEVERAL of our readers have written to us to the effect that the licences which they took out at the beginning of the year authorise them, without any qualification whatever, to keep one motor bicycle or tricycle from the date of issue until the 31st day of December next following, and they wish to know whether the Government propose to treat these licences—German fashion—as scraps of paper, or whether these documents are not legally and morally binding upon the authorities who issued them. There seems to be much sound sense and good reason in these contentions. They would not, of course, apply to those who have taken out licences since the new proposals have been before Parliament, and to whom licences are issued at the old fee of 20s., this amount being considered to be an instalment.

It certainly seems hard that a man, who has carefully studied ways and means, and after much economy and self-sacrifice, has decided that he can just afford to run, say, a sidecar outfit for the benefit of his wife's health (and there are many such), should be compelled, through lack of means, to give up his one hobby when nearly half the time for which he has paid his hard-earned cash has not elapsed. Many a man who is working hard for the good of his country in mine or factory gets only alternate Sundays free, and, supposing he owns a 6 h.p. sidecar, his yearly tax, including driving licence, will be £4 19s. 6d., or 3s. 10d. in tax for every outing, and his petrol tax will probably amount to another 6d. Such a man might well argue in this way, "Why should my neighbour, a well-to-do man of no occupation, ride daily on horseback, as well as riding to hounds, without paying any tax, while I, who can get out but once a fortnight, am compelled to pay nearly £5 and 6d. on every gallon of petrol used?" We confess that we do not know the answer.

Frankly, we believe that a moderate tax on motor cycles would bring in a larger revenue than the excessive rates proposed, which our post bag proves to be beyond the reach of very many, reluctant as they are to give up their weekly or fortnightly trip into the country, at the present moment resplendent in varying shades of vivid green and pink and white blossom. The health-giving properties of such scenes must be worth much to jaded workers or to the wounded from the seat of war.

## A Plea on behalf of the War Worker.

EVERY reader knows the tale of the goose that laid the golden egg. What is very much akin to that allegory is the effect of the rising price of petrol. Petrol kings to-day demand 6d. per gallon on petrol over the amount charged a week or so ago. The spirit most commonly used by motor cyclists now costs 2s. 10d. per gallon, and so the increases may go on *ad infinitum*. But do the clique who are lining their purses realise that they are nearing the limit, and that many users of petrol will be lost to them by overdoing the extortion? Every jump means so many less users—which in itself shows the unfairness of the prices. We make no protest on behalf of "joy riders," what few exist, but we do complain in the strongest possible manner on behalf of war workers, who, with week-ends only to refresh themselves, are faced with unequal obstacles. The health and strength of the nation at this juncture are of vital necessity; soon the poorer motorists will be driven off the roads by exorbitant charges, and will be led to spend their little spare cash in much less healthy pursuits. And the result? Instead of the Chancellor of the Exchequer reaping his estimated increase of £800,000 from motors, he will have watched helplessly the action of our petrol kings in "killing the goose." *Why should not the Government limit the price of petrol?*

BY

LXION

### The Old and the New.

I suppose most riders accept their manufacturers' standard handle-bar without grumbling? I always fake mine more or less, as pedal cycle experience taught me how a few microscopic modifications of the riding position can increase one's comfort enormously. In the old days I used to get a heavyweight to sit in the saddle and help to hold the machine steady, whilst I put my foot against one handle-grip and tugged at the other. A crude method, if you like, but one that recommended alterations of handle-bars to more than one maker. My latest machine has a peculiar handle-bar mounting; the bar is held in two clips fixed to the top of the fork sides, the idea being that the bar cannot turn in the stem when you are wrenching a sidecar round a bad corner. But it has this further merit, that by slackening the grips you can set the bar in almost any position, from the "swallowed-a-poker" to the full T.T. It is true that the angle of the grips themselves would be awkward in several positions, but the range permitted is quite satisfactory, and has saved me from ricking my elderly self in efforts to get the best position. I do not see why the grips should not be screwed into the bar and provided with locknuts; if this addition were made the bar would literally afford a complete range of adjustments.

### Excess of Oil in Two-strokes.

Not long ago I spent an interesting Saturday afternoon watching various touring motor cyclists ascend a rather abnormal hill in the course of their ordinary travel. None of them knew there was a chiel takin' notes at hand. The four-stroke machines performed very creditably, but the two-strokes put up a miserable show with the exception of a Triumph and a Clyno, and in each case faulty oiling methods were to blame, for which the driver bore some of the guilt. Whenever a two-stroke failed, or made a very slow and uneven climb, or experienced anxiety, the rider apparently allowed himself to be surprised by the hill. He suddenly realised that hard work lay ahead, and either opened up his drip valve or injected a pumpful or so, with the result that the mixture was upset by excess of oil in the crank case, and the engine commenced to four-stroke. He then perforce changed gear, and raced his engine to keep up speed, with the result that in several instances oil was flung on the sparking plug points and misfiring set in; in some cases it brought about a total stoppage, in others the points gradually burnt themselves clean, and the rider got up, after his engine and transmission bearings had undergone considerable strains.

### Some Advice.

I should have thought that every two-strokist had learnt by now that the peculiarities of this type of

engine call for extra heavy oiling on hills, but that the extra oil must be given some distance before the grade commences. Two-stroke engines get perceptibly hotter than four-strokes when they are working hard (witness the necessity of water-cooling on 500 c.c. samples), and if they are run for a mile on low gear with a liberal throttle allowance and normal oiling, they conk their souls out and get excessively hot. In other words, oil-cooling must be added to air-cooling when you are climbing a really bad hill. But if a heavy charge is injected, or the drip is opened wide with too great suddenness, the mixture will certainly be upset, and in all probability the disturbance will produce four-stroking. The extra oil should therefore be fed to the engine very gradually, and at some distance from the start of the climb. It will pay to drain out any unconsumed excess at the top of the hill; if I were a designer I should fit my two-stroke engine with a hand-controlled drainer at the pit of the crank case, like that used on one or two car engines. If the surplus oil is allowed to accumulate, carbonisation will be excessively rapid, and dirty plugs will become a common occurrence. There is a world of difference between handling the babies in the undulating Midlands and in the genuinely hilly parts of England.

### One Plug, One Job.

I have written before on the suitability of various plugs to various engines, notably on the merits of thin electrodes in oily engines, because the thin points get so hot that they burn up oil instead of sooting, and of thick plugs for high efficiency engines, because they cool better by reason of their thickness, and so do not get incandescent and pre-ignite. Here is an actual experience to the point. I was driving a high-efficiency twin-cylinder, and was grievously tormented by the plug of one cylinder getting drowned with lubricating oil, and yelling for a clean-up every third or fourth mile. There was no time to investigate the cause of the uneven supply of oil between the cylinders—probably a faulty piston ring, though it must be admitted that many twins suffer from this particular failing. I purchased a cheap old-fashioned plug from a dealer's store, selecting one of the ancient type recently revived in the Ford interest, with 'long, thin electrodes. I was almost ashamed to insert it in place of the 7s. 6d. racing plug, which was oiling up so regularly, but it did the trick; it burnt up the surplus oil as fast as it was deposited, and I was able to finish my journey non-stop. Needless to say, I could not overdrive the engine freely, as the spidery points would soon have turned white hot. Oddly enough, the same plug came in handy next day for similar service on a light car, which was also suffering from one oily cylinder. I shall make a point of keeping one spare of this type about my place.

## ON THE ROAD

WITH A  
POWERPLUS INDIAN

A fast stretch of road south of Dorking.

OUR first ride on the 1916 Powerplus Indian was a very brief affair, consisting as it did of a short run through the traffic, up one of the Hampstead hills, and back again to Euston Road. The combination ran so well, and the new side-by-side valve engine appeared so sweet running and flexible, that we looked forward to an extended trial with this fascinating machine.

The other day, while calling at Maude's Motor Mart, we happened to mention this to Mr. G. Pettytt, and he kindly suggested we should take out a slightly used second-hand combination of this type which he had for sale. Now it is one thing to drive a machine which is the manufacturers' demonstration mount, and consequently always kept at concert pitch, and another thing to take a chance second-hand model from a dealer's show room, as was the case on this occasion, and we were certainly agreeably surprised. This particular Indian was fitted with the Splittorf magneto dynamo, which worked particularly well, and a most luxurious Mills and Fulford sidecar, to which was fitted an excellent Cape cart hood and a Dunhills windscreen with side shields, all of which tended to add greatly to the passenger's comfort.

Our first drive was made to a small village near Aldershot, where we had a business call to make. It was a plain, straightforward run, and presented no difficulties, but it sufficed to demonstrate the excellence of the clutch and the ease with which the change speed could be manipulated. As those who have read the description of this machine may be aware, the clutch has a duplex control, and may be actuated either by the foot or hand. The latter method was seldom employed, as the leverage of the pedal had been well calculated, and the clutch operation was quite delightful on account of the small effort required

to withdraw it. Many American machines need the clutch to be not absolutely in engagement to prevent "snatching," but with the Indian this was unnecessary, as the drive was at all times quite smooth. It was in acceleration and hill-climbing that the machine particularly excelled, and owing to the splendid balance of the engine, which was as good as one could expect in a V twin, it was delightfully smooth running. We were also much interested to note the absence of valve clatter, which was due to enclosing the valve stems and guides and the abandonment of the overhead inlet valves.

During the journey just referred to the most noteworthy performance was the climbing of the Hog's Back on top in the teeth of a south-westerly gale; the engine pulled magnificently, tackling the steep portion in excellent form and picking up rapidly when the gradient eased. Both on this occasion and on the next day we were particularly impressed by the cool running of the engine and the total absence of any knocking under any circumstances. Much bad road surface was traversed on both days, when the springing of

the frame was much appreciated. The climbing of Reigate Hill on top speed was another feat which excited our enthusiasm.

So far we have dealt only with the good points of the machine. To say that there was no fault to find would be an exaggeration, but we purposely refrain from the other kind of criticism, as the machine did not belong to the maker's London house. We may say frankly, however, that there was little with which we could find fault. Our second day's run was made in heavy rain, which, we are happy to state, in no way affected the ignition or lighting systems. Altogether we were most favourably impressed with the Powerplus Indian.

## POWERPLUS FEATURES.

Fully described in "The Motor Cycle"  
of October 21st, 1915, page 394.

By H. ADDISON, B.Sc., A.M.I.C.E.

IN THREE INSTALMENTS. (The first appeared in the issue of May 4th, page 422.)

**P**ERHAPS the conclusions reached in the preceding article will be more readily understood in the graphic form shown in fig. 3, in which the actual values of the inertia forces are given for various positions of the crank pin. They have been calculated, by means of the formulæ already put forward, for an engine in which the weight of the reciprocating parts  $W=1\frac{1}{2}$  lb., crank radius  $R=1\frac{1}{2}$  in., speed  $N=1,800$  r.p.m., and length of connecting rod  $L=7\frac{1}{2}$  in. At the top of the stroke, fig. 3 (a), the primary force  $P$  has a value of 169 lb., and the secondary force  $S$  has a value of 34 lb. After the crank has moved through  $45^\circ$ , fig. 3 (b), the corresponding figures are 120 lb. and 0 lb.; at the half centre, fig. 3 (c), the primary force has diminished to zero, while the secondary force now acts downward with an intensity of 34 lb.; and so on. It should be explained that all these forces act through the centre of gravity of the reciprocating mass; they are shown offset in the diagram merely for the sake of clearness.

The net inertia force transmitted to the motor cycle frame is, of course, the result of the primary and secondary forces; thus, the total upward inertia force at the top of the stroke  $P_T$  is in this case  $169+34=203$  lb., and the maximum downward force at the bottom of the stroke  $P_B$  is  $169-34=135$  lb. In simpler language, at the top of each stroke there is a force of 203 lb. tending to lift the motor cycle bodily off the ground, while at the bottom a downward force of 135 lb. comes into play. These figures demonstrate in striking fashion the vital importance of making every effort to reduce the inertia effects, and of balancing them if at all possible.

#### A Popular Fallacy.

In view of the misconception which appears to exist on this point, the present opportunity may be taken

of emphasising a fact which has hitherto been taken for granted, viz., that the inertia pressure is absolutely independent of the gaseous pressure in the cylinder. Since the inertia force depends solely on the acceleration of the reciprocating parts, its intensity for a particular crank position will be precisely the same on the suction stroke as on the explosion stroke, on the exhaust stroke as on the compression stroke, and whether the throttle is closed or fully opened, *provided* the engine turns at the same speed in each case. Similarly, from the point of view of balancing, a two-stroke engine is on exactly the same footing as a four-stroke, other conditions being equal.

#### Balancing a Single Cylinder.

We are now in a position to consider how, and to what extent, the inertia forces can be counteracted. In the single-cylinder engine the only method available is to use a revolving balance weight; this must obviously be situated opposite the crank pin,

and the question then remains as to how heavy the weight should be to give the best results. Let us first try the effect of a weight whose centrifugal force would just balance the maximum upward inertia force  $P_T$ . For clearness we will use the values of  $P_T$ ,  $P_B$ , etc., obtained above for an engine running at 1,800 r.p.m. At the top of the stroke, then, the upward inertia effect being 203 lb., perfect balance would be attained if the balancing mass exerted a centrifugal force of 203 lb. (see fig. 4 (a)). This state of affairs would only be momentary, however; the balance would be upset immediately the piston commenced to move, and by the time the crank pin had reached the half centre we should have the full centrifugal force of 203 lb. acting horizontally, quite unopposed. In other words, the balance weight itself would now be "unbalanced," and there would be a horizontal force at work on the motor cycle just as severe as the inertia force we are endeavouring to neutralise (fig. 4 (b)). The engine

Fig. 3.

**The Mechanics of Balancing.—**

would also be out of balance at the bottom of the stroke to an extent of 68 lb. (fig. 4 (c)).

**The Best Compromise.**

A much better result will be attained if only *half* the maximum inertia force is balanced (fig. 5 (a)). The balance weight will then be required to exert a centrifugal force of about 101 lb., leaving an unbalanced force at the top of the stroke of the same amount, *i.e.*, roughly 101 lb. At the half centre (fig. 5 (b)) the unbalanced force will still be 101 lb., and a little reflection shows that this is very nearly the best, or, rather, the least unsatisfactory, compromise that is possible. Such a figure as it stands would appear to justify the phrase, "the horrible unbalance of a single-cylinder engine"; but the many thousands of single-cylinder machines giving perfect satisfaction on the road show that a comparatively large unbalanced inertia force does not produce the ill-effects that might be anticipated.

**The Rider's Point of View.**

Although balancing on the system outlined above reduces the unbalanced forces to a minimum, it does not necessarily follow that the vibration set up in the motor cycle frame will also be brought to its lowest point. It may happen that the frame is more susceptible to vibration in one direction than in another; for example, a small unbalanced force acting in a vertical direction may set up serious vibration, and render the machine uncomfortable to ride, whereas a much greater force acting horizontally would produce a negligible effect from the rider's point of view. Whether or not this is the case can only be determined by experimenting with different balance weights; in the instance just cited the balance weight which gave the best results as regards absence of vibration would be found to be heavier than that which ensured the least unbalanced force.

Fig. 5.

**Balancing a V Twin Engine.**

As is pretty generally known, the 90° V twin engine can be comparatively well balanced, but as the angle between the cylinders diminishes, the balance becomes

less and less satisfactory. These facts admit of quite a straightforward explanation. Dealing first with the 90° type, the reason for the high degree of balance obtainable in this engine is made clear in the diagram, fig. 6. As a matter of fact, the primary forces can be

completely balanced, and the only unbalanced effects are the secondary ones due to the obliquity of the rods. Neglecting these latter, we know that when the back piston is at the top of its stroke, and is consequently exerting its maximum upward inertia force P, the front piston is at mid-stroke, and is therefore responsible for no primary inertia effect. A balance

weight can hence be placed opposite the crank pin, which will ensure perfect balance at this point (fig. 6 (a)). After a quarter of a revolution the front piston now exerts its maximum effect, while the primary force due to the back piston has fallen off to zero (fig. 6 (b)); but as the balance weight has also moved round through 90°, complete balance exists in this position too. A similar state of affairs holds good when the pistons are at the bottom of their respective strokes, and a simple geometrical proof will demonstrate that at any intermediate position the combined primary inertia forces of both cylinders are entirely counteracted by the centrifugal force of the balance weight. There is, however, no means of balancing the secondary forces; indeed, in no class of engine is it possible for these forces to be neutralised by a rotating balance weight.

**Effect of Reducing the Angle between the Cylinders.**

Coming now to engines in which the angle between the cylinders is less than a right angle, these may be regarded as being intermediate between the single-cylinder type and the 90° twin. It requires no great stretch of the imagination to consider a single-cylinder engine as being really a twin in which the angle between the cylinders is 0°; at any rate, this is quite a rational supposition as far as the inertia forces are concerned. From this it follows that if the cylinders of a twin are set at a small angle, the engine will behave, as regards balancing, more or less like a single, but as the angle increases its behaviour will more and more resemble that of a 90° twin.

The precise manner in which this variation takes place is shown graphically in fig. 7, in which the unbalanced force (or, more briefly but less elegantly, the

Fig. 6.

**The Mechanics of Balancing.—**

"unbalance") is plotted vertically for different angles. It will be observed that when the angle between the cylinders is  $40^\circ$ , the unbalanced force or "unbalance" has the value 0.97. As the angle increases, the unbalanced force diminishes rapidly; thus, at  $50^\circ$ , it is 0.82; at  $60^\circ$ , 0.66; and at  $90^\circ$ , 0.28. Comparing a  $90^\circ$  twin with a  $50^\circ$  machine, then, we find that the unbalance in one case is only about one-third of what it is in the other, or, expressed in another manner, the balance of a  $90^\circ$  engine is nearly *three* times as good as that of a  $50^\circ$ .

As for the exact value in lbs. of the unbalanced force, this can at once be determined when it is explained that the decimals in fig. 7 represent fractions of the maximum primary inertia force  $P$  of one set of reciprocating parts. For instance, if,

Fig. 7.

at a given speed,  $P$  is found from the formula already quoted to have a value of 95 lb., then the unbalanced force in a  $90^\circ$  engine at that speed will be  $0.28 \times 95 = 27$  lb., or in a  $50^\circ$  it will be  $0.82 \times 95 = 78$  lb. It may be added that these figures represent the maximum unbalanced forces still at work after the engine has been balanced as thoroughly as is practicable by the use of a revolving balance weight. The values given are only the theoretical ones, and, as has been pointed out before, it does not necessarily follow that they will agree with the results that experience has shown to be most satisfactory. The only other comment called for is that the curve (fig. 7) has been calculated on the assumption that the connecting rods are equal to five crank lengths.

(To be concluded.)

## PISTON TAP OR WHAT?

### Explanatory of the Peculiar Tapping noticed on some Twin Machines.

**B** EING a big twin enthusiast I was naturally keenly interested in a discussion which I overheard being carried on recently between some half dozen keen twin riders relating to a problem which had often puzzled me and many of my friends with several big V twin machines which I have owned from time to time. The discussion commenced by the rider of a new 7 h.p. chain driven American mount asserting that his machine was not wearing well, as already, after only two or three hundred miles, he could hear the distinct "tap, tap," of a worn big or little end. On first hearing the noise he had thought it was a tappet which had become unadjusted. Upon examination, however, all the tappets were found to be in perfect order. Then the argument began.

Everyone was convinced the trouble was not ordinary wear: they had all experienced this little peculiarity in various big and little V twins which they had owned, and although they could assure the new owner that the trouble was not due to big or little end wear, their opinions as to what was the real cause and remedy were decidedly at variance. It is just possible that the various opinions and remedies given may be of interest, and some may be of value to readers who have also experienced this apparently harmless, though to some riders particularly irritating, trouble.

#### Insufficient Lubrication.

One rider was assured by the makers of his big twin that the tapping he heard was due to insufficient lubrication of the front cylinder. He accordingly dismantled his engine, and arranged two metallic scrapers at the base of the cylinder in such a manner that they scraped the film of oil from the flywheels and directed it into the orifice of the front cylinder.

This improved matters to a certain extent, but the tapping frequently recurred after a stretch of hard driving all out. He accordingly then fitted an auxiliary oil feed to the rear wall of the front cylinder. This, he asserted, entirely disposed of the irritating symptom, and conclusively proved from his point of view that the tap was entirely due to lack of lubrication.

Another rider who had experienced the tap in both single cylinders as well as twins after fast driving was convinced that the noise was due to distortion of the cylinder due to excessive heat, probably caused through insufficient lubrication, and that the only remedy was a new cylinder and piston.

A third attributed it to the slack fit of the front piston, done intentionally by some manufacturers in order to compensate for the extra heat generated in the front cylinder due to insufficient lubrication—a trouble from which practically all V twins suffer.

#### Unequal Sparks.

Another suggested it was the construction of the armature of the magneto, it being almost impossible to produce two sparks of equal intensity with the staggered armature necessary to ignite two cylinders set at an angle, and so in order to overcome this the front cylinder was caused to ignite earlier, which sometimes, especially when running under heavy load, caused the slight knock. This theory is rather knocked on the head by the fact that many riders have experienced the same peculiar tap on a single cylinder machine, especially where the cylinder is not vertical, from which it would appear that the inclined cylinder is to some extent responsible for the trouble. Other readers' experiences and opinions on this matter would be of interest.

TRIALS RIDER.

# THE RISKS OF IMPERFECT ALIGNMENT

At least ninety per cent. of the machines seen on the road this Easter were of the family sidecar variety, ridden for the most part by elderly men with their families aboard, and the entire absence of speedy solo mounts was one of the most striking signs of the times. It is usual to see quite a large number of outfits during such seasons which are incorrectly adjusted in one way or another, but it would seem that the grey heads of the pastime who now reign supreme are the very worst sinners as regards the alignment of their sidecars. Never before have I seen so many outfits being ridden at perilous angles, so far as vertical alignment is concerned, as this Easter, and it would seem that many family men are so harassed by the thought of the sidecar-lifting that they attempt to lessen the likelihood of such mishap by taking risks of a far more potent kind.

## The List to Port.

I refer to the risk of broken couplings when the outfit is run with the machine leaning in towards the sidecar, and this risk is very much enhanced when a passenger is mounted on the carrier. The lean on several machines I saw made one shudder to behold, and in some cases was so considerable that it clearly required a good deal of energy on the part of the rider to hold the machine to its course when on the left camber of the road. I noticed a 6 h.p. twin outfit carrying a 14 stone rider, and with a 12 stone pillion passenger, and the lean was so great that the unfortunate couplings could actually be seen to yield on taking a right-hand corner! And this is the class of rider who gives his make of machine a bad name among his neighbours if anything finally breaks.

## A Simple Illustration.

The subject is not new, but let us approach it in a different way with a view to demonstrating the excessive strains that take place when an outfit is ridden with the machine leaning inwards.

Fig. 1 represents, for the sake of convenience, an improperly aligned sidecar outfit viewed from the rear. A C is the motor cycle, B C the axle tube of the sidecar chassis, and A B the torque tube between the chassis and the saddle pillar. The circle at A represents a weight of 20 stone, this being the weight of the rider and pillion passenger, and the

curved line below the triangle is a section of the road surface.

It will be seen that since A C, which represents the motor cycle, leans towards B, the centre of gravity falls to the left of the point C. In other words, the curved torque tube is at all times supporting a certain proportion of the weight which would fall direct upon the rear wheel if the motor cycle were vertical.

Fig. 2 shows what happens with the machine in its normal position on the left camber of the road. The strain on the torque tube is then very much increased, the vertical arrow indicating the centre at which the weight falls. Now imagine the enormous strains which must take place when an outfit arranged thus takes a right-hand corner on the left camber of the road, as it inevitably must do several times during a day's ride. The entire weight of the two riders and much of the weight of the machine is then thrown in the direction indicated by the horizontal arrow, and there is very

little to resist it except the torque tube A B and the rigid attachment at C. The torque tube being (in all probability) curved, is bound to yield to some extent, and the attachment at C is then subjected

to a very considerable breaking strain, which it is badly placed to resist.

## Correct Position.

To what extent these strains are reduced if the outfit be set as shown in fig. 3 is clear at a glance. With the machine in its normal riding position, the weight of the rider and passenger then fall dead on the centre of the rear wheel, and the torque tube is normally idle. In taking a right-hand corner (even though one be forced into the gutter) the pressure placed upon the torque tube is considerably less.

There is but little to be gained in safety by leaning the machine towards the sidecar, while incorrect alignment causes excessive tyre wear and increased fuel consumption. Sidecars of the family type do not lift on corners if handled with any degree of sanity, while the danger of a broken chain stay coupling, or of a torque tube suddenly buckling, is serious. H.M.B.

The record of 2h. 15m. 20s. for the 90 miles circular trip round the island of Oahu, Hawaii, has been lowered by a Harley-Davidson rider.

Fig 2.

Fig 3

# THROUGH FEMININE GOGGLES.

## THE LADY ANGLER AND HER MOTOR CYCLE.

**M**OTOR cycling seems far removed from the dreamy, abstracted sport of angling, but a motor bicycle and sidecar is the "magic carpet" which deports the angler from home to the fishing waters in the minimum time. No sport so solitary, therefore no sport so restful—fishing is the one pastime in which one can pleasantly indulge without human companionship. I was invited lately to a day's pike fishing by a lady who is never so happy as when, with line cast, she watches the float on the gently

climb Sundon without resorting to bottom gear appealed to my tastes—if I dare admit the fact—far more than an afternoon spent in capturing one tench, and a small one at that.

Our first duty on reaching the happy hunting ground was to interview the farmer-owner of the lake, and pay the 1s. each person is charged for the right to try one's luck—or skill. Fish in plenty could be seen bobbing to the surface, but they were too cute to be had, "on toast," and one had ample time to

Welcome arrival of tea.

Throwing the line.

The owner of the lake.

rippling surface. The day was ideal and the sun overcast as we left the main road at Dunstable, then through Houghton Regis and Toddington to the Harlington Lake, which is famed in Bedfordshire for its power to provide a good day's sport with the rod. The local hills encountered were as level ground to our J.A.P.-engined combination, and to the driver the journey was all too short for a morning spin. My inclinations were to visit Sundon Hill, close by, and try the capabilities of my mount. To

Ready for home.

study the picturesque scene, with the grand array of bulrushes and water flowers.

At the close of the day—I felt that, with all the charm of the water and of being alone with nature, I still could not quite comprehend my companion's pleasure in the "gentle art."

For me—ah!—the open road, and the well-known mount, and

the days of no fear about waste of petrol! But tastes vary, and there is no doubt that fishing appeals to many.

MAY WALKER.

## MOTOR CYCLES IN THE MEXICAN CAMPAIGN.

**J**UDGING by our Chicago contemporary, *Motor Cycling and Bicycling*, the great source of trouble with the motor cycles attached to the United States force operating against Villa is the lack of good riders. The desert tracks have caused their share of trouble, but the average man put in charge of a U.S.A. military motor cycle appears to be an absolute "dud." One would have thought an appeal for expert motor cyclists to act as despatch riders for the duration of the campaign would have resulted in better service

being obtained from the machines that the U.S.A. military authorities have recently purchased. There are thousands of keen, young Americans who would jump at the opportunity. The Mexican dogs appear to be very plentiful and a great nuisance. All the Mexican Indians have quite a fleet of them. "Shut your eyes and hurl a brick in any direction around Colonia, Oublan, or Casas Grande, and you will hit a dog once in three shots. The average of the motor cycle despatch rider is a good deal better than this."

## PEACE—AND WAR!

ONLY a few days ago I was steadily wending my way across the summit of the Sussex Downs. Having no need to hurry I paused once or twice, propping up my motor cycle the while, to gaze upon

the magnificent views stretched out before me. From one point a small section of railway could be easily distinguished, its course zigzagging like some gigantic snake away towards the coast, the latter stretching out like some exaggerated portion of an ordnance map to east and west. Then in the distance the blue hazy mist spake of the sea, which in appearance was almost summerlike on this beautiful April day. Remounting, "we" proceeded further inland, halting halfway down the steep sloping road that leads to Poynings, that fascinating little village at the foot of the Downs which is a feature of A. E. W. Mason's "Broken Road."

### "Sussex by the Sea."

"We"—there are some who dare suggest that there is no sympathy between man and motor cycle—always make a point of halting at this spot when in the Sussex highland district to admire the village just mentioned, and also to gaze in admiration at the rolling Downs, of which the highest point in Sussex—Crowborough Beacon—is such a prominent feature.

Having partaken of as much of our fill—one can never have too much of this kind of "stuffing"—as

time permitted, "we" "carried on" through Fulking, continuing along the road running 'neath the foot of the Downs until Shoreham and the sea were reached.

One moment, gentle reader. Have you thought why I should mention the sea here? Probably you never thought about it. Well, somehow the sea reminded one again of the "horror"—the horror that is affecting us all in some way or another. Is there need for further explanation?

### Reminiscences.

Half an hour ago it would have been hard—tremendously hard—to consider that across that blue strip of water part of the largest fight the world has ever seen was taking place, as we paused and gazed admiringly on the quiet, peaceful scene before us, but even up there one glimpse of the ocean was enough to remind one that only a few months ago one was in the midst of the horror itself.

Only the previous day "we" had another jaunt through leafy Sussex to a snug little cottage nestling 'neath another portion of the same range of Downs. There the writer took tea amidst the most peaceful surroundings imaginable. "We" were on a long-promised visit to a friend there to re-tell the tale of a despatch rider's life in

WHAT MOTOR CYCLISTS ARE DOING  
IN THE WAR, BESIDES DESPATCH  
RIDING AND SERVING IN LINE  
REGIMENTS.

(Top) A motor boat patrol.  
(Centre) Aeroplane pilot.  
(Bottom) Mechanical transport driving.

## POYNINGS. AND THE DYKE HILLS. SUSSEX

Northern France and Flanders. Once again "we" were plunged in the midst of war, surrounded on either hand by a perfect peace. Thus on two successive days has war been brought back to me, though far from the madding crowd.

### Other Scenes.

Now comes the other side of the picture. It all comes back again as one writes—scenes one has witnessed of wrecked and ruined homes, the practically totally destroyed Cloth Hall and Cathedral of Ypres, the bombardment of Dunkirk, roads teeming with homeless and helpless refugees trudging seemingly ever onward to God knows where.

As one writes a scene such as that described returns vividly to the mind without effort. These things seem to be photographed on the brain of those who come upon them suddenly and without warning. Along a certain highway "somewhere in France," consisting

of dust-strewn *pavé*, running alongside the bank of a canal, terminating eventually in the heart of the horror itself, we—another mount then—carried our messages. One day we noticed a goodly portion of the population of — coming in an apparently never-ending stream towards us. The reader may guess the meaning of that congregation. Homeless! One word will suffice to sum it all up. It appeared as though the enemy knew where those homeless civilians were directing their weary footsteps, thereby tracking them down, for the writer heard later that the town they were making for was also bombarded with 17in. shells shortly after.

Many other and practically everyday sights could one write of dealing with life "over there," but this one sample will suffice to show the different aspects of life which I have witnessed during the last few months where apparent Peace and real—terribly real—War reign supreme.

R. L. NYE.

The taking of, among others, the photographs that appeared in our last issue of scenes in Dublin immediately after the rebellion led to the arrest of the photographer, our regular Irish correspondent. Luckily he was only detained by the military authorities for about an hour.

**ECONOMY  
AND  
UTILITY**

The title of a Special Number of  
"THE MOTOR CYCLE,"  
to be published on Thursday,  
June 29th.

## HEALTHY RECREATION for WOUNDED SOLDIERS

THE second sidecar outing for wounded soldiers, organised by the Harley-Davidson Co., took place on Saturday last. As before, the wounded came from St. Thomas and the City of London Hospitals—two up-to-date institutions which have recognised the value of the sidecar for this particular purpose. In our report of the first event of this nature, organised a few months ago, we were justly enthusiastic over its success, and it was then impossible to imagine that any similar outing could be more successful, but so it happened, not owing to any greater forethought and kindness on the part of the organisers, nor of the splendid band of helpers, but on account of the perfect weather which prevailed. It was simply glorious; there was just enough southeasterly wind to temper the scorching noon-day sun, and the country in its fresh spring green looked its very best. The organisation at the start was perfect, the machines turning into the hospital drive and taking on board first the worst cases, so that the poor fellows need not walk a step further than was necessary, while the others walked down the line and found themselves seats. There were forty-two wounded men in sidecars and a few in cars as well, so the procession when it started punctually at 12.30 was a most imposing one.

At the start, splendidly arranged by Mr. Duncan Watson, the drivers and their passengers had to face a regular battery of kinematographs and cameras, and then in Indian file threaded their way across Westminster Bridge and along the Chelsea Embankment. Practically perfect order was kept, the only scorches being the photographers who rushed ahead to get pictures at different vantage points. Our passenger was one of the few who had taken part in the first outing, of which he could not say enough

in praise. He had been wounded in September, had had eight months in hospital, and between the two outings had had an operation.

### A Pleasant but Uneventful Journey.

The journey down was without incident. Once near Roehampton we slowed down to oblige the kinema man, but most of the time we kept among the first ten, who were led by Mr. Duncan Watson, himself driving a sidecar combination. There are too few managing directors of important motor cycle firms who drive their own machines. There was only one fault to be found, and that was that too close order was kept in the column, so that the passengers and drivers had to suffer too much dust at times. Only one sidecar driver, as far as we were able to gather, arrived late owing to a puncture, but one of the two or three cars was badly hung up owing to tyre troubles, and several of its passengers were brought up in sidecars which went to their rescue. The soldiers were one and all delighted with their drive. We heard one telling a friend with great delight that his photograph had been taken while he was trying to wipe his dusty face by the aid of his driver's handle-bar mirror.

Lunch of a good simple type, and plenty of it, was served in an iron room, passengers, drivers, and officials numbering some 125 in all. It was made as short as possible, and then all went out into the beautiful grounds of the Burford Bridge Hotel, and sat on the lawn and listened to talented artists, who sang just the right kind of songs.

### "Sweet are the Uses of Advertisement."

The concert began by all present singing the National Anthem, those of the soldiers who could stand at attention. Then, after one or two excellent musical

turns, Mr. Watson spoke a few words of welcome. He told the soldiers that it was their day, and he hoped they were enjoying themselves. They owed a great deal to the drivers who had so loyally responded to the call for their services. Opposite him at lunch had sat a young Scottish warrior who on the occasion of the last outing had been in bed; though operated on last Wednesday, he had got out of bed this morning, determined not to miss this outing for worlds.

A cynic would say that all this was done for advertisement. Now advertisements were of two kinds, good and bad, and he hoped this would be a glorious one, and that all others similarly placed to himself would vie with one another to give wounded soldiers as good a time as possible. He mentioned that the Chairman of the Auto Cycle Union, Mr. Otto Thomas, was present to give an official tone to the gathering, and also members of the motor cycle press; to them also he extended a hearty welcome.

Sgt.-Maj. Thorogood replied on behalf of the soldiers in a few well-chosen words. There was only one thing, he said, harder than making a speech, and that was convincing a woman she was wrong. (Laughter.) This had been the best day he had ever had, and on behalf of his fellow soldiers he expressed his heartfelt thanks, and called for cheers for the organisers and the drivers.

### The Intentions of the A.C.U.

Mr. Otto Thomas (*The Motor Cycle*), chairman of the A.C.U., was called upon to say something on behalf of the body he represented. He began by referring to the debt of gratitude due to the brave soldiers who had suffered in the cause of King and Country, and went on to say what a splendid example Mr. Duncan Watson and the Harley-David-

**A Sidecar Outing for Wounded Soldiers.—**

son Motor Cycle Co. had set. The Auto Cycle Union had the interests of soldier motor cyclists at heart, and would do its part to see that those who suffered in the war were not left unemployed. The A.C.U. would endeavour to see that work would be found for all who had been in the industry. An organisation with this end in view was actually in existence, a committee of the Royal Automobile Club having been formed for this purpose. The soldiers present should keep this fact in mind and tell others of it, as it was not intended to let those who had fought for their King and Country live on the charity of the nation or die of want, as had happened years ago after the Crimean War.

Before the concert cigarettes and matches were given to the soldiers by the Harley-Davidson Co. During the concert Miss and Master Watson gave each wounded man a box of cigarettes, and in each box was a card wishing the recipient good luck and a speedy recovery, from the proprietors of *The Motor Cycle*. An interested spectator was Sir Hugo de Bathe, husband of Mrs. Langtry, who is the rider of a Harley-Davidson. During the afternoon he handed Mrs. Watson a handsome bouquet of flowers, subscribed for by the soldiers. During tea boxes of chocolates were distributed to the soldiers by Mr. Watson's children.

On the way home our passenger told us that he had been a turner in the general

Leaving hospital.

engineering trade, and that he was just on the point of joining a motor business when war broke out, so we told him that when he received his discharge we would use every endeavour to find him work.

All arrived back at the hospital having thoroughly enjoyed their day, and most of the outfits arrived in good time, only a few being delayed by punctures.

**Notes.**

Two lady artistes who had performed at the open air concert worked indefatigably afterwards by waiting on the soldiers during tea on the lawn.

After the concert, while tea was being prepared, and during the meal, one of the wounded *souvenired* the piano, and played rollicking ragtime tunes, which were heartily applauded.

When the London police on point duty saw the long line of sidecars threading their way through the traffic they quickly rose to the occasion, and whenever possible the procession was allowed a clear road. The official car was caught in the police trap in Roehampton Lane.

W. Cooper made an excellent suggestion to the effect that the Motor Cycling Club might organise a similar outing. We heartily agree, and would give the club every help in our power.

Before starting, every driver was presented with a couple of Union Jacks, which he attached to his machine. The organisers knew their business, and everything was well done.

An impressive incident was when drivers, guests, and officials formed a circle on the lawn, crossed hands, and sang the old Scottish ballad, "Auld lang syne."

**MILITARY NOTES.****AN OLD CAMPAIGNER.**

**F**RANK P. MAYELL, before the war, was known in Midland motor cycling circles by reason of his being captain of the Sutton Coldfield and Mid-Warwickshire A.C. Upon the outbreak of war he joined the Warwickshire Yeomanry, with which regiment he had served through the South African campaign, and he is now in Egypt. Readers who know Mayell will be glad to hear he is very fit, in spite of seeing service on the Gallipoli Peninsula, and taking part in a more recent scrap east of the Suez Canal.

**CANADIAN MILITARY NEWS.**

**A**CCORDING to a Toronto correspondent, Lt.-Col. Robert Starke, of Montreal, in command of the McGill Contingent, Canadian Officers' Training Corps, has arranged for the raising of a motor cycle machine gun and despatch riders' section of the corps, to consist of 150 men. The motor cyclists will carry out their preliminary training at the Champ de Mars, a local parade area, and later will take part in extensive tactical exercises.

Capt. Thom, Divisional Signalling Officer, Montreal, has also issued a call for about twenty-five motor cycle riders for home service. Four or five

will be allotted to each of the local home regiments, and the men will participate in field manoeuvres this summer. The riders will be trained as signallers and scouts. They will constitute a training depot for overseas despatch riders.

**A MOTOR CYCLE WITH A HISTORY.**

**I**T is not possible to write the full story of the early pattern Douglas illustrated on this page, for the reason that details of its early days are at the

moment lacking. The knowledge that is available, however, shows that the machine in question has had a career very different from that usually followed by the average motor cycle. This old stager, which is still running well, was picked up out of the sea at Suvla Bay, Gallipoli. It is believed that an officer took it out with him. It was brought back to Alexandria, and left in the workshops. Here Cpl. H. J. Batley, R.E., who sends the photograph, found it, and he tells us that, though rusty, it started with no trouble when the attempt was made.

Cpl. Batley is quite an old stager, so far as this war is concerned. He joined the despatch riders in the early days, and was attached to a cavalry division in France until twelve months ago, when he was wounded. After eleven weeks in hospital he returned to France, and was quartered at an advance base, when injuries to his right arm caused another five weeks in hospital. Batley then joined an R.E. training depot in the South Midlands, when he was sent to Egypt to look after a Douglas wireless set.

Harold Karslake, who joined the R.F.C. some time ago, is now a flight sergeant (technical).

An early pattern Douglas that was picked up out of the sea at Suvla Bay.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Central Office for Heavy Section, Machine Gun Corps and Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Central Office for R.E. Despatch Riders:

Mr. T. W. Loughborough,  
A.C.U., 83, Pall Mall, London, S.W.

THE Heavy Section, Machine Gun Corps, has lately been gazetted. Recent recruits have been allotted to this armoured car section, and more men are still required, though it cannot now be stated how long recruiting will remain open. The conditions of enlistment are precisely the same as for the Motor Machine Gun Service, which latter section is another branch of the Machine Gun Corps. A few men with engineering knowledge, who are neither car drivers nor motor cyclists, can be accepted for the Heavy Section.

A limited number of experienced motor cyclists and car drivers, able to execute running repairs are also wanted for the Motor Machine Gun Service.

At Coventry last week there was the usual crowd of motor cyclists and car drivers from all quarters. North countrymen flocked to Manchester on Wednesday, and in a busy afternoon fifty men were examined and the majority accepted.

Next week's inspections of recruits for the Heavy Section, Machine Gun Corps, are as under:

COVENTRY.—Recruiting Office, Masonic Buildings, Tuesday, 30th inst., 11 a.m. to 4.30 p.m.

LONDON.—The Motor Cycle Offices, 20, Tudor Street, E.C., Saturday, June 3rd, 2 to 4.30 p.m.

Readers desiring to join should attend at time and place stated. There is no need to write, providing men conform to the conditions enumerated on this page. Men coming to Coventry should be prepared to proceed to the training centre at once if accepted.

Married men should bring their marriage certificates and birth certificates of children (if any), and all should bring their Reserve cards.

The following men were accepted last week at Coventry and Manchester:

Amery, C. F., Chagford.  
Arden, G. W., Kettering.  
Armstrong, E., Holden Bridge.  
Baggott, S., Hincley.  
Baker, R. W., Bowden.  
Banner, F. H., Warrington.  
Barber, A. G., Downham Market.  
Bartlett, J., Pontypridd.  
Barton, A. E., Tibshelf.  
Beddow, A. E., Willenhall.  
Bell, P., Mansfield.  
Bennett, V. L., Downham Market.  
Bettley, J. A., Willenhall.  
Bond, G. E., East Dereham.  
Brander, F., Evesham.  
Branson, C., Hereford.  
Brierley, S., Chorlton.  
Briggs, J. W., Bradford.  
Bright, E. T., Langworth.  
Brown, P. V., Thetford.  
Callaghan, J. B., Glossop.  
Clarke, H., Evesham.  
Clewley, J., Wolverhampton.  
Cooke, C., Portsmouth.  
Cooper, D. F., Golden Hill.  
Cotter, M., Birmingham.  
Cowap, T. W., Cumberbach.  
Cowan, L. D., Dalston.  
Croad, A. W., Pontypridd.

Currie, G. W. F., Manchester.  
Davies, L., Newton-Willows.  
Diamond, E., Millom.  
Dodd, A. M., Dudley.  
Drewery, J. F., Scotton.  
Dunn, F., Bradford.  
Eastham, W. H., Accrington.  
Eatough, C., Mossley.  
Edmanson, C. S., Sheffield.  
Edmondson, J., Chaburn.  
Ennis, L., Tonyrefail.  
Ewen, E., Boston.  
Fairweather, R. E., Dundee.  
Featherstone, F., Brooklands (Cheshire).  
Fillingham, E., Crowle, Lincs.  
Fitzjohn, C. H., Southampton.  
Gawthrop, W., Colne.  
George, H. G., Swansea.  
Gibson, T. C., Barrhead, Glasgow.  
Gray, C. E., Hammersmith.  
Gray, E., Peckham.  
Griffin, L., Dundee.  
Gunnery, H., Manchester.  
Hacking, H., Accrington.  
Haigh, V. S., Huddersfield.  
Hall, W., Redditch.  
Harkness, W. E., Hexton, near Hitchin.  
Harrison, A. W., Droitwich.  
Harrison, V., Birmingham.  
Hawkins, A., Luton.  
Hill, G. H., Bilston.  
Hill, S., Redditch.  
Hotchiss, G., Connahs Quay.  
Howard, C. E., London.  
Jacobs, W. A., Hampstead.  
Jones, E. G., Bangor.  
Kearns, J., Urnston.  
Keightley, T., Lincoln.  
Kellett, J., Lytham.  
Kim, G. A., Leicester.  
King, J., Daran.  
Large, A., Gorton.  
Laycock, C., Halifax.  
Maddocks, H., Manchester.  
Marr, J., Maryhole.  
Marsden, A., Darwen.  
Miles, W. J., Coventry.  
Moloney, Crickwood.  
Murray, R. J., Kirklington.  
Oliphant, A., Carlisle.  
Parkinson, S., Lincoln.  
Philpot, G. W., Coventry.  
Ray, F., Sleaford.  
Rhodes, F., Liversedge.  
Rowntree, L. E., York.  
Rutherford, W., Kelso, N.B.  
Sanderson, A., Longridge.  
Saunders, H. G., Wolverhampton.  
Shepherd, J. G., Harrogate.  
Simpson, J. E., Caulton.  
Slinn, A., Coventry.  
Smith, W., Halifax.  
Sneath, E., Sheffield.  
Stone, H. O., Taunton.  
Taylor, W., Putney.  
Thomas, J., Coventry.  
Tinline, J. D. M., Teignmouth.  
Treadgold, F. H., Grimsby.  
Tunncliff, C., Blackburn.  
Walker, W. E., St. Anne's-on-Sea.  
Wallace, H., Rugby.  
Watson, G. E., Rotherham.  
Whiteley, A., Whitefield.  
Whitely, W., Kendal.  
Wiles, W., Nottingham.  
Wilkinson, J., Sheffield.  
Williamson, C. H., Ashton-under-Lyne.  
Worthing, F. W., Beverley, Yorks.  
Yates, A., Blackburn.

For the guidance of prospective recruits, the conditions of enlistment are appended:

Applicants must be experienced car drivers or motor cyclists, able to execute ordinary running repairs.

Pay, 1s. 2½d. per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limit, 19 to 40.

Applicants must be fit for General Service abroad, or for Garrison Duty abroad.

Several recent recruits have seen service in France, either with the Red Cross, the Church Army, or the Quakers.

## SOME FACTS ABOUT THE M.M.G.S. AND H.S.M.G.C.

WHEN the Motor Machine Gun Service was first formed it was known as the Suicide Club. The Armoured Car Section of the M.G.C. is now popularly referred to in the camps as the "Hush, hush," section.

The Heavy Section of the Machine Gun Corps, the recruits for which have passed through the editor's hands for some weeks past, has now been gazetted. Lt.-Col. R. W. Bradley, D.S.O., formerly commanding the Motor Machine Gun Service, has moved over to the new Section, and his successor is Major R. J. Colson. The Heavy Section and the M.M.G.S. are two entirely different sections of the Machine Gun Corps, with separate camps.

Major R. J. Colson, the new commanding officer of the Motor Machine Gun Training Centre, was in command of the original—No. 1—Battery. He was then a captain, and it is a fact worthy of record that this No. 1 Battery of the M.M.G.S. was the first batch of Kitchener's army to go to France on Active Service—a distinction which should alone preserve the fame of the sidecar machine gun batteries. The machines used then were two-stroke Scotts.

It thus appears only fitting that the officer commanding the No. 1 Battery should take his place at the head of affairs when the post became vacant. Major Colson and his battery had a long spell of Active Service in France, and the C.O. returned home wounded last year.

Last week we made a tour of Bisley Camp, the M.M.G.S. training centre, and saw scores of brown faces undergoing the various phases of their training. Motors, it may be mentioned here again, do not appear on the scene until a recruit is regarded as almost a fully trained soldier. Many a man has been disappointed because he was not allotted a motor vehicle from the start, but this is obviously impossible.

By the way, if the new Bisley camp kitchen can be beaten for cleanliness and orderliness we should like to hear of it. No wonder that every man, from the C.O. downwards, is proud of such an acquisition.

The training camps are situated among the most healthy and picturesque surroundings. During the winter the camp boasted a first-rate football team, including several professionals. It reached the final in a military cup contest.

Shortly some sports are to be arranged for the men in training.

## TIME TO LIGHT LAMPS

	"SUMMER" TIME.	
May 25th ...	...	9.26 p.m.
" 27th ...	...	9.29 "
" 29th ...	...	9.31 "
" 31st ...	...	9.33 "

### Police Traps.

One of our readers informs us that he was caught in a police trap recently in Vauxhall Bridge Road at 7 a.m., and on a week-day, too.

### A Home-built Sidecar.

The weight of the boat sidecar body illustrated on page 481 of our last issue is 22 lb. P. Reekie, of Birkenhead, designed and built it himself in his spare time.

### A Comparison.

During last week we drove two sidecar combinations—one British and one American. The Britisher had a semi-automatic lubrication system and a two-lever carburetter which was most difficult to throttle down. The American mount had completely automatic lubrication, to which we did not have to give a thought, and a splendid automatic carburetter capable of an infinite amount of external adjustment when required. Needless to say, we unfortunately preferred to drive the latter. English manufacturers must wake up.

## SPECIAL FEATURES

HEALTHY RECREATION FOR WOUNDED SOLDIERS.  
ON THE ROAD WITH A POWERPLUS INDIAN. THROUGH FEMININE GOGGLES.

### An Important Point.

The great advantage of automatic lubrication is that it takes the responsibility of giving the engine sufficient oil from the driver to the maker. If it is adopted, as it ought to be, the manufacturer will not be able to give the worn out excuse in the event of a breakdown that enough oil had not been given. It will have been the duty of the maker to see that the lubrication was correct before delivery.

### Economy.

Petrol must be saved. Riders should therefore not make unnecessarily long journeys, but make short trips to some attractive spot, camp out for the day, walk through the woods, and return in the evening. Just as much benefit will have been obtained from a health point of view as if a long ride had been undertaken.

### Well-known Rider Married.

Gordon I. Francis was married to Miss Annie E. Barnett on May 9th. In times of peace Francis was associated with the Lea-Francis Co.; now he holds a commission in the A.S.C., M.T.

### Munition Workers go Hill-climbing.

A party of munition workers, mainly from Barrow, had a successful hill-hunting expedition in Lakeland last weekend. The route was planned by Mr. George Abraham, and a description of the proceedings from the pen of this well-known writer will appear in our next issue.

### Pleasure Motoring. The R.A.C. Enquiry.

The R.A.C. has conducted an exhaustive enquiry, which proves conclusively that pleasure motoring has practically ceased to exist. This, for the most part, refers to cars, but the principal motor cycle clubs have also been consulted. The returns from the garages all over the country show that if all private motoring were banned the number of men released for more useful work would be negligible.

### Price of Petrol.

As the majority of our readers know, to their cost, further increases in the price of petrol were made last week. Prices now ruling in England and Wales are as follow:

	Per gal.
Shell ...	2s. 10d.
Shell II. ...	2s. 9d.
Crown ...	2s. 8d.
Pratt's Perfection ...	2s. 10d.
Pratt's II. ...	2s. 9d.
Taxibus ...	2s. 8d.
Mex ...	2s. 9d.
Red Line ...	2s. 10d.
Red Line II. ...	2s. 9d.
Ensign ...	2s. 8d.

The Shell and Crown prices represent an increase of 8d. per gallon.

In Scotland and Ireland the average prices are a penny more per gallon.

The great cost of petrol and the manner in which the chief petrol companies are bleeding all classes of motorists will force many users to curtail considerably, if not give up altogether their motoring.

A SECTION OF  
THE LIVERPOOL MOTOR  
CYCLIST VOLUNTEERS.

Liverpool possesses one of the finest motor volunteer corps in the country. The majority of the men are now in uniform, and a great amount of useful work is being done. The above photograph was taken at last Sunday's parade.

**Imports of Motor Cycle Tyres.**

In a Parliamentary answer, Mr. Pretyman says that the value of motor cycle tyres and tubes imported in 1913, 1914, and 1915 were respectively £101,000, £40,000, and £105,000.

**Healthy Recreation for the Wounded.**

Continuing our policy of dealing with week-end events in the following Thursday's issue, this number of *The Motor Cycle* contains the first illustrated description of last Saturday's sidecar outing for wounded soldiers.

**Future Irish Trials.**

As already suggested, the disturbed state of affairs in Ireland is likely to result in the abandoning of the majority of the motor cycling competitions which were to take place this year. The Cork and District Motor Cycle Club has announced the "indefinite postponement" of its Twenty-four Hours Open Trial, fixed for Whit-Monday, and the Dublin and District Motor Cycle Club is holding a special meeting this week to consider the question of running its open twenty-four hours or abandoning it.

**The Latest Madness.**

Though contradicted in one quarter, the report that Sunday motoring would shortly be prohibited is interesting, as showing that the outcry against "pleasure" motoring is still in existence. If Sunday motoring is prohibited, surely Sunday golf, cinemas, and 10s. 6d. dinners at fashionable London restaurants should be. In fact, motoring, being such a healthful form of recreation, should be the last form of pleasure to be seriously interfered with.

**Substitutes for Petrol.**

Two recently announced substitutes for petrol are Wital and Benzolite. The former is sold at 1s. 5d. per gallon, and the selling firm states that the user starts on a mixture of 50% Wital and 50% petrol, and then, as soon as the engine is warm, it will take pure Wital. Benzolite costs 1s. 10d. per gallon, and, we are told, is giving satisfactory results with motor cycle engines.

Apparently both these fuels cannot be obtained in less quantities than 40 gallon casks. This fact will, we fear, not encourage the use of either fuels by the average motor cyclist who only uses his machine for week-ends.

**A Cloudy Drip Feed Glass.**

Recently while driving a 3½ h.p. single when the weather was rather cold we found that the drip feed glass became half full of oil, and it was impossible to see whether or not the lubricant was flowing through. We first of all made sure that the oil pipe was quite clear, and when we found that this was so we removed the screw valve which controls the number of drops per minute, and then, having replaced the oil pipe in position, placed the nozzle of the tyre pump up against the orifice, gave half a dozen strokes, and the oil was immediately forced to the bottom. The glass barrel kept perfectly clear for some considerable time afterwards. Despite being half full the drip worked perfectly well, but it was certainly comforting actually to see the oil flowing.

JUNE 29th, 1916,

IS THE DATE OF

THE  
MOTOR CYCLEEconomy and Utility  
NUMBER.**Light Car Driver Returns to Motor Cycle.**

Capt. H. Nelson Smith, of the Warwickshire Regt., a former director of the Hillman Motor Car Co., Ltd., Coventry, and a well-known performer on Brooklands, has returned to his old love—the motor cycle. We met him last week on the way to Wolverhampton to get his new mount, a 3½ h.p. chain-driven Sunbeam. Capt. Smith is with his regiment on Salisbury Plain, where life is almost impossible without a motor of some description on which to get about.

**The Taxes.**

Let us hope that the delay on the part of the Treasury in making a further announcement respecting the new taxes on motor vehicles means that the evidence with which they have been provided is being sifted most thoroughly. It is certain that if the whole of the facts as outlined are considered, the Treasury will adopt a much more equitable rate of taxation than that originally proposed.

**The Motorists' Contribution.**

It is pointed out in the leading article this week that if motoring becomes prohibitive owing to high charges the people of this country will have £800,000 more to find in taxes, as this amount was the yield estimated by the Chancellor of the Exchequer as the result of his proposed new taxes on motor vehicles.

**The National War Funds.**

The principal war funds at the week-end stood as follows:

The Prince of Wales's National Relief Fund (£3,258,000 distributed)	£5,874,308	0	0
Fund for the Sick and Wounded	3,743,099	0	0
The Queen's Work for Women Fund	169,446	0	0
Tobacco Fund	106,811	0	0

**Registrations in the Metropolis.**

The London County Council during the quarter ended March 31st last registered 1,405 motor cycles under the Motor Car Acts, thus bringing the total registrations of these machines up to 44,435. There were 788 changes of ownership, making 22,050 changes since registration began.

**Keynotes of the Motor Cycle.**

The utility and economy of the motor cycle will receive special attention in *The Motor Cycle* of June 29th. The use of motor bicycles as a cheap means of transport and the growth of the side-carrier will both be dealt with in a thorough manner. The variety of uses to which the modern motor cycle may be put, whether for military or civil purposes, is really surprising.

**Enforcement of Lamp Regulations.**

The recent Lights on Vehicles Order prescribes the use of three lamps on vehicles—two in front (white) and one at the rear (red). The number of accidents that have happened in the past clearly shows the necessity for this Order, but the Commissioner of Police of the Metropolis has hesitated to press it unduly on account of the difficulty that has been experienced in obtaining the necessary number of lamps. He is now satisfied, however, that this difficulty exists no longer, and that suitable lamps can be easily obtained. There is no excuse, therefore, for the use after dark of vehicles unprovided with the necessary lamps, and from the 1st June next the police will be instructed to enforce the law in all cases where a contravention is observed.

Some men of the Royal Flying Corps at present stationed in the West Riding of Yorkshire. On the carrier is a South African motor cyclist who came from Natal to join.

# AIDING TH OF T LAST SATURDAY WOUN

(See pages 493 and 4

Glorious weather favoured the second Harley-Davidson sidecar outing for men from the St. Thomas and City of London Hospitals. Forty-two men were taken a country ride in sidecars and a few cars.

# CONVALESCENCE WOUNDED.

## SIDECAR OUTING FOR SOLDIERS.

(full report of the proceedings.)

The photographs show various stages of the outing from the start to the Burford Bridge Hotel. At the top right-hand corner the driver of the sidecar is Mr. Duncan Watson, to whose energy and thoughtfulness the great success of the outing was mainly due.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable

### A MOTOR CYCLIST IN RUSSIA.

THE photographs from Russia reproduced herewith, show Sub-Lt. Bedford, R.N.A.S., who in happier times has been a winner of many gold medals on Hazlewood and Rex-Jap motor cycles. Now he is with the British armoured car section in Russia. As is only to be expected, he finds the climate very cold, but particularly healthy and dry. When the thaw comes it will probably be worse than England and very difficult for transport. By wearing suitable clothing one can keep the body adequately protected, and it only leaves the hands and feet, which really do get cold at times. Doubtless Bedford will be able to give some useful hints and advice regarding clothing to competitors in the next Exeter run. The expedition is splendidly equipped with the latest type armoured cars and transports down to Douglas motor cycles.

### EFFICIENT MUD- GUARDING.

IF, for reasons of economy, the motor cycle is to supplant the small car for the use of professional men, some improvement in mudguarding is necessary, and the illustration on this page shows how this may be accomplished. The Harley-Davidson in question is fitted out with Waigh's patent mudguards, as made by

A BRITISH MOTOR CYCLIST IN RUSSIA.

## A TEST OF "SPOTS."

AN ATTEMPT TO SOLVE THE PROBLEM OF CHEAPER FUEL.

WE recently made a test of the preparation known as "Spots," sold by the Coal By-Products Co., 40, Holborn House, High Holborn, W.C., which, the makers claim, gives more power to the engine and a 25% better petrol consumption. The machine on which the test was carried out was a new War Office model  $3\frac{1}{2}$  h.p. P. and M. and sidcar, and the test was made in the following manner. A small tank to hold one quart of petrol was purchased from the Service Co. This tank is designed to fit on the front mudguard of the motor bicycle, and on the sides thereof are intended to be painted the registration numbers of the machine. For our purpose, however, it was placed transversely on the centre of the top tube, and was secured by two straps crossing one another, while the tank was saved from damage by placing two pieces of sheet rubber between it and the auxiliary tank. Next the petrol pipe was disconnected from the tank union, and a tap which we had fitted to the auxiliary tank was connected to the end of the petrol pipe by a piece of indiarubber tubing.

The night before the test was carried out, half of one of the "Spots" tabloids was placed in a carefully measured gallon of petrol. Next, 8 oz. of the treated spirit were placed in the tank, and this was done on Brooklands track, and a start was made from the beginning of the mile, the object being to see how far we could run on the treated spirit. The first attempt was a failure, as, owing to the track being under repair, we were forced very high up the bank, with the result that the petrol would not feed. We next sought the assistance of Mr. Rance, the track manager, and he suggested that the best place on which to test the fuel would be on the finishing straight, on which there was a measured half-mile where the races in the last United Services Meeting were run.

The treated spirit was again carefully measured out, and we proceeded, with Mr. C. P. Preston, who is responsible for the sale of "Spots," in the side-

car, to cover this distance as long as the fuel would last. The tank ran absolutely dry just short of  $4\frac{1}{2}$  miles. No appreciable difference in power was noticeable, and we were also careful to note that very little, if any, extra air was required by "Spots." Previous to filling the tank with treated spirit the float chamber was emptied. Next, the same test was carried out under precisely similar conditions with the same quantity of petrol, and the tank ran dry after covering  $3\frac{1}{2}$  miles.

This means that on the occasion of this particular test "Spots" gave an increase in consumption of about 28%. These results worked out to ninety miles and seventy miles to the gallon respectively, which is interesting, as on a long run over give-and-take roads the consumption of the machine on pure petrol during the Easter week-end worked out to sixty miles per gallon. It is claimed that "Spots" increases the carbon contents of the fuel, and in this way improves the mileage per gallon.

The run home from Brooklands was made on the treated spirit, and we noticed on the way back no apparent increase in power. Although

the machine was fully loaded, it took the hill out of Brooklands on top speed, but we imagine that it would have done equally well on petrol. The accompanying photograph shows the manner in which the tank was attached to the machine, and the way in which it was connected up to the carburetter.

It will be agreed that the result of the foregoing test is quite extraordinary, and consequently we have arranged a further test of "Spots," which we shall carry out on a different make of machine fitted with a different carburetter from the one already used. The result of this second test will appear in an early issue.

It would be interesting to see how the treated petrol would behave when given a series of tests by such official bodies as the Auto Cycle Union and the Royal Automobile Club.

Sidcar on which the "Spots" test was carried out. The temporary tank is shown strapped to the top tube. The size of a "spot" may be judged by the specimen lying on the footrest.

# Economy

is due from all. You cannot have a better means of effecting extreme economy, than by the use of the "New Imperial Light Tourist," as its low cost of running is so marked—averaging almost twice the mileage of other types of the same power. In addition, you have the "Perfect Dependability" and "Ease of Control" so markedly present in the "Light Tourist." The price of the

## Top Feed Carburettors.

Sir,—May I through the medium of your journal venture a reply to Capt. Lindsay's criticism of my previous letter regarding top feed carburettors.

I own to confessing "that I had met with trouble from choked filters," but not in connection with the carburettors on our machines, which are fitted with a well-designed and efficient filter and sediment cap.

I must admit that when it comes to a question of time his method of float chamber inspection beats mine; but on the very rare occasions when it is necessary to inspect the interior of a float chamber we, as a matter of precaution, inspect the jet also, and, for this reason, find this method is better than the simpler expedient of disconnecting petrol union and unscrewing the float chamber lid.

I am afraid the mention of a bayonet joint brings unpleasant memories to my mind. I was once the possessor of a carburettor fitted with a float chamber lid of this description. Alas! its ease of removal was sadly counter-balanced by the equal ease with which it allowed the petrol and oil to escape in company *via* this self-same joint to proclaim loudly my petrol lubrication.

I am, of course, aware that a combined tap and filter does not improve the design of any carburettor; but I feel I must draw Capt. Lindsay's attention to the enormous number of W.D. Douglas machines running at the present moment which carry this fitting, "although they are fitted with a celebrated make of bottom feed carburettor which owns its own filter."

I also have charge of several 1915 machines fitted with bottom feed carburettors, and, in justice, must admit that they perform satisfactorily, but alas! this is in a great measure due to the fact that the petrol is strained by a combined tap and filter before it reaches them.

I hope my letter will not convey the impression that I am in civil life a petrol tap and filter manufacturer, but at the risk of this impression I must say that I would like to see every make of machine fitted with this inexpensive and invaluable little fitting. It appears to me infinitely better to collect the foreign matter as it leaves the tank in preference to collecting it when it reaches the carburettor.

MOTOR CYCLIST SERGEANT.

## The Taxation of Motor Cycles.

Sir,—In February I took out a licence for a motor cycle. On the licence it distinctly states, without any qualification whatever, that I am "authorised to keep one motor bicycle or tricycle from the date hereof until the 31st day of December next following." In the face of that how can the authorities come on me for any extra tax till next January? However, I suppose the Government is going to follow the German example, and simply treat it as "a scrap of paper."

If I were a wealthy motorist I should flatly refuse to pay any extra taxation till next year. Not being in that position I shall either have to sell my machine, if possible, or take it to "uncle's" till we get a more reasonable scale of taxation. In my opinion, if the Government persists in the proposed new motor taxation it will find it to be a case of "killing the goose that lays the golden eggs" in more senses than one.

6 H.P.

Sir,—With regard to the motor taxes, I will say nothing as to the increased amounts, but what seems to concern me most, and seems very wrong, is to bring them into force before the existing licences have expired. All of us hold

a licence in which the State has authorised us to keep a motor for the year ending December 31st, 1916. This is surely a contract between the State and the subject, and it is far from just for the State to depart from their own terms.

The Chancellor has knowledge of the existing licences, and therefore, by causing them to end in June and August next, he is causing the State to retract from an undertaking entered into with many thousands of citizens.

I feel strongly that all taxes must be constituted honourably and weigh justly with one and another—that is, if good is expected to come from the use of the money. W.P.

Sir,—Could you possibly find a little room in your splendid paper, *The Motor Cycle*, re the new taxation for motor cycles?

I notice in the "Question and Replies" columns a query with regard to the tax on a  $3\frac{1}{2}$  h.p. machine. It is replied to as being £3 3s., the same as that of a 10 h.p. light car of last year.

I am temporarily employed by the Admiralty, and have Sunday duty to perform, and, living in the country (with a decidedly awkward train service), considered the purchase of a  $3\frac{1}{2}$  h.p. Norton for the purpose of fulfilling the aforementioned "Sunday duty," but on second consideration deem the new tax fabulous, and have abandoned the idea.

I imagine myself to be one in a million who will suffer thusly, and it goes a long way to prove that a motor cycle is anything but a luxury; it is, in fact, in hundreds of cases a necessity. J.F.D.

[The proposed tax on the  $3\frac{1}{2}$  h.p. Norton is £2 2s., as this machine has a small bore and a long stroke.—Ed.]

Sir,—As a regular reader of *The Motor Cycle* I should like to express my opinion of the recent increase in taxation. The modifications have been carried out in a most unfair and unbusinesslike manner, and there seems little hope of there being any redress. Surely the fairest way is to increase the tax on petrol, then the people who use the most pay the most; it would stop joy-riding (if it exists), and would tend to improve consumption. Failing this, I certainly think *The Motor Cycle* scheme is best. Could not a form be printed in *The Motor Cycle*, which every reader would be glad to sign and forward to the Editor? I own a 5 h.p. four-cylinder F.N. second-hand price £17 10s., and it is annoying, to say the least of it, to see a car of double the power, and costing, say, £200, getting off with a £4 4s. tax, while I have to pay £4 14s. 6d.

FOUR-CYLINDER.

Sir,—In the various objections to the heavy additional tax on motor cycles stated in recent correspondence I have not seen my particular case dealt with.

I have a 6 h.p. cycle and sidecar which, I suppose, comes under the £4 14s. 6d. tax. It was bought second-hand three years ago, and I only average about 1,500 miles a year, having only the opportunity during Saturday and Sunday afternoons for riding, except for the week's holiday once a year. The tax therefore represents nearly  $\frac{1}{2}$ d. per mile in itself, and I should think there are hundreds of other riders in a similar position, and upon whom it will fall very heavily. A rider covering 10,000 miles per year is therefore taxed only  $\frac{1}{2}$ d. per mile, and, therefore, it seems to me that a tax on petrol would have been far preferable, as it would have

be more uniform on the user, whether he owned an Auto-wheel or a Rolls-Royce £1,000 car, the tax depending on the distance travelled.

Why not a tax of, say, ½d. per cubic centimetre, or even 1d., in war time, and insist upon makers in future having the capacity cast on the cylinders or stamped thereon? Thus makers would not be sacrificing their engines by trying to keep them, say, under the 200, 300, or 400 size, but if they found a capacity of 208 suitable for them, they would know their customers would not object to eight additional halfpennies or pennies as the case may be.

However, when all is said and done, the very best way is to tax petrol, if it must be done, and so equalise taxation on all users, big or small.

#### EQUALISATION.

Sir,—I think it is shameful to put such a heavy tax on a growing industry, and a very great hardship, because everybody that owns a motor cycle is not a millionaire. In fact, here, in Cornwall, you can see miners riding motor cycles to their work. When men work half a mile down a tin mine, and do not spend their money in beer, but on a motor cycle, so that they can get about and have a little more fresh air, to enable them to go down the mine and help to raise the tin and wolfram for the Government, it is very hard that they should be so highly taxed. At the commencement of the war the Government taxed petrol, with other things. There was no grumbling then, but now that they suggest an extortionate tax on the motor cycle I say it is time that someone agitates before it is too late.

CORNISHMAN.

Sir,—I have read Mrs. Willoughby's letter to *The Motor Cycle*, and deeply sympathise with her. My case is much similar. My wife is a helpless invalid since last May; my son, our only child about eighteen years, is almost blind; both are entirely helpless. I was advised by the doctor to give them both plenty of fresh air. Last November I bought a new Royal Enfield combination, and since then we have had some splendid runs. I am only a working tradesman, who could just manage to keep things going, but now, with this excessive tax, I shall have no option but to lay my machine aside or sell out. I think owners of push cycles should be asked to pay a little instead of always increasing the tax of the motor owner.

ROYAL ENFIELD.

#### Magneto Advance.

Sir,—Your enquiry for an advance or retard device to be used on Dixie magneto or other makes was first unnoticed by me. Before the war broke out I made a device enabling one to advance or retard the magneto spark, and still keeping the magneto on its maximum firing point. My device was offered to a British maker a short time before the war, who answered me that it was not very useful, and not much used, so that the usual one could remain unaltered, so I decided to keep it till after the war. I now send you a rough sketch of the device, which has been delivered for protection. Description:

A is the magneto sprocket.

D the last gear wheel from the engine. The magneto wheel is disconnected from D wheel by slightly raising the magneto.

D C B Toothed wheels are geared together so that the gearing goes from D to G, B, and A fitted to the magneto.

B and G wheels are fitted on the articulation point of a sort of

parallelogram. The bars E and F pivot on the centre of wheels A and D, and pass under them, as shown by dotted lines.

The bar G connects the wheels B and C, and passes over them.

The wheels B and C are fitted only to the parallelogram, and move with it in a down and up motion to a certain extent round A and D wheels. The up and down motion is given by the bell crank lever pivoted at the point L and set in motion by a Bowden wire and cable carried to a lever fitted in the usual manner on the handle-bar.

A spring not shown on the sketch is necessary for the reverse motion, as will be understood.

You will easily comprehend that if you move the wheels B and C up or down by means of the handle-bar lever connected to the bell crank lever H the magneto spark will be advanced or retarded, and whatever be the position of the lever the firing point will remain "unaltered," and that could not be attained in the usual device.

In case of magneto chain drive, the magneto chain sprocket A should be removed to D.

GEORGE-BALLNOT.

Tours, France.

#### Paraffin as a Fuel.

Sir,—I enclose a rough sketch, also a photograph, of an appliance which I have devised and fitted to my 3½ h.p. single-gear Triumph motor cycle to enable paraffin to be used instead of petrol. The air is drawn into the carburetter through a pipe which is contained within the enlarged exhaust pipe. The air pipe is covered with asbestos cord

from the exhaust pipe to the carburetter in order to prevent dissipation of heat. The engine is started on petrol from an auxiliary tank, and then the paraffin is turned on. As a matter of fact, I find it possible to start by injecting a teaspoonful of petrol through the compression tap. I have

driven the machine on household paraffin for 400 miles by means of this attachment with the following results: No undue overheating, no loss of power on the level or hills, no more carbonisation than with petrol, and no objectionable fumes.

As an instance of what the machine will do on paraffin, I drove it from Manchester to Blackpool and back, pulling a heavy coach-built sidecar, driver 12 st., passenger 10 st., and a two-gallon can of paraffin on carrier. The machine climbed all hills excepting one where I was baulked by a cart. The appliance (which I have protected provisionally) has the advantage of simplicity, cannot get out of order, could be fitted to most machines, and would be cheap to manufacture. Paraffin consumption averages 65-70 m.p.g. over give and take roads with no alteration made in the original Triumph carburetter.

WM. BARNETT.

#### Motor Cycles in Malta.

Sir,—We notice in your issue of April 27th, which has just reached us, that Mr. Rossiter, writing under "Naval and Military Notes," states "there are disgracefully few motor cycles in Malta."

As we think that this is calculated to give quite a wrong impression, we may mention that we have between fifty and sixty customers who own motor cycles on our books. We really cannot agree that this is disgracefully few for an island approximately eighteen miles long and nine broad. You illustrated a beautifully equipped F.N. combination a few weeks back, and we may say that nearly all the well-known makes are represented here, including Triumph, New Hudson, Douglas, Scott, Enfield, Bat, etc.

We can only wonder where Mr. Rossiter spent his weeks of waiting without seeing many of these machines.

The main roads here have a very fair surface, but they abound in the most wonderful bends and corners, and on a wet day are a searching test for the skidding propensities of a machine. The local drivers have the very vaguest ideas about the rule of the road, and frequently draw right across your path when you sound your horn. Lightweights, with two-speed gear are most suitable for solo work, and a powerful machine is desirable for sidecar work, as some of the hills are very severe.

DOWNS AND JOHNSON.

Malta.

## QUESTIONS

## REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Four-stroking.

**Q.** Can you explain the cause of a 2½ h.p. two-stroke "four-stroking"? I have examined the carburetter, but have not discovered any signs of flooding; also the oiling seems to be about correct.—N.G.B.

The trouble is usually due to the use of a carburetter to which the incorrect size jet is fitted. This is likely to be either too large or too small—more probably the former. Too small a jet usually causes popping back into the carburetter.

## Driving without a Licence.

**Q.** I was on a journey the other day, and was pulled up for driving my motor cycle without a driving licence and a registered number. Can I be summoned for not having a registered number, and for using a false one? The number I used was registered in my name, but on a 1915 model, and not on the motor cycle I was using at the time.—J.T.H.

Certainly you may be summoned for not having a registration number and a driving licence, and your licence would be endorsed. You have been obviously guilty of driving without a licence, and also of driving an unregistered machine.

## Overheating.

**Q.** I have a 4½ h.p. single-cylinder motor cycle. The engine gets very hot, even when riding solo. I have tried using smaller jets, but this does not make any difference. I use Coolie oil, and lots of it. The engine pulls well, and the compression is good, but after travelling about five miles the cylinder will blister my hands if I touch it. I have just had the engine down, and scraped all deposit from the cylinder and piston, but it is still the same. I have tried everything I can think of, and I should be grateful if you would help me out of the difficulty.—H.J.

You can seldom bear your hand on the coolest running motor cycle cylinder after it has run four or five miles. If the machine pulls well and does not lose power through overheating, we do not think you need worry about not being able to bear your hand on the cylinder.

## How to Fit a Magneto Switch.

**Q.** I have a twin-cylinder Douglas, and wish to fit a magneto cut-out. I have already bought one, and by connecting to front plug I have successfully cut out the front cylinder. Is it necessary to buy another cut-out in order to stop back cylinder firing? If not, would you please tell me how to connect up?—R.C.D.

What you will have to do is to apply to the makers of your magneto, and ask them to supply you with a contact breaker cover to which a switch terminal is attached. Then connect this terminal with a piece of low-tension wire to the cut-out switch on the handle-bar. What you have done at the present time is to fit a high-tension cut-out, which is quite wrong, firstly because it cuts out only one cylinder instead of both, and secondly because in wet or damp weather in the act of operating it you will get a very severe shock, which will probably throw you off the machine.

## Difficult Starting.

**Q.** I have a new 4½ h.p. which will not start with the kick starter. I have sometimes to run it for about fifty yards before it starts; after that it goes very well. As it has not done 200 miles, I would be pleased if you could let me know a remedy, as I have a bad foot and cannot run very well with it.—L.E.

Starting difficulty is nearly always due to the carburetter receiving too weak a mixture at slow speeds. This is usually caused by the use of too small a jet, an insecure joint between the carburetter and the engine, which allows air to get in, or to not having the air properly closed. Engines are less prone to start in cold weather than when the weather gets warm. See that all doubtful joints are bound with adhesive tape. You might also look to the following adjustments: See that the contact points are clean, that the rocker arm is quite free, and the points separating the correct distance, viz., .4 mm. Make sure the plug is in good condition, quite clean, and adjust points to give a gap of about ⅜ in. See that the valve springs are strong enough, and tappets adjusted with a clearance of not more than .4 mm.

## Handle Starting.

**Q.** I have a 3½ h.p. motor cycle and sidecar, with Precision engine, handle-starting Roc two-speed gear. I find difficulty in starting—being rather short armed and not very strong in the arms. I find it rather a job to get a start when the engine is cold. Would fitting a decompressor assist matters? I presume I should not have to raise exhaust valve lifter, which would give me my left hand free and would make it easier work turning the handle.—J.F.

A decompressor would probably help you to start to some extent, although we think that if you get your engine and carburetter correctly adjusted you should have no trouble. Starting with the handle is largely a matter of "knack." If a decompressor were fitted, you would not have to lift the exhaust valve.

## Knocking.

**Q.** I have a 1916 4 h.p. counter-shaft Triumph motor cycle, and have done about 600 miles, and it has started knocking—on hills, against the wind, and when changing from second to top gear. I have done everything I can think of—cleaned cylinder and piston, adjusted tappets, ground valves in, changed plug, and the spark takes place on dead centre of firing stroke with the lever fully retarded. I cannot find any play in the bearings. I may say when the machine is running on the level and not against a bad wind it runs beautifully. The knock sounds as if there were a lot of play between the valves and tappets on the start of a hill, and then this grows into a knock as the gradient increases.—C.F.D.

We should say that the trouble is probably due to the machine being geared too highly. If there is too much clearance between the valves and tappets it is easy to reduce this. It is better not to allow the engine to knock more than you can help, as usually this means a big strain upon the bearings. The following are the most usual causes of knocking: Dirty engine, loose bearings, worn piston rings, too high a gear, ignition too far advanced, weak mixture, too rich a mixture causing overheating.

## PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in the working of the Government decision to limit the import of paper material by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

**Valve Overlap.**

**Q** I have recently received back my 4 h.p. single after a makers' overhaul. The valve timing is now as follows: The exhaust closes dead on top of the stroke and the inlet begins to open just the smallest fraction before the exhaust has found its seat. Is this right, or would it improve matters to time the inlet to open a tooth later? At present there are no noises in the carburetter, and the engine will run more slowly than of old. I have always understood, however, that the exhaust valve should have shut before the inlet starts to open.—J.T.

We should recommend you to retain the makers' setting of the valves if the machine is giving satisfaction. Altering the timing of the inlet a tooth would probably be much too much. Quite a number of machines are timed with a slight overlap in the valve settings, especially for speed work, and, provided no difficulty is experienced in running slowly or starting, the overlap is likely to be of benefit.

**Misfiring.**

**Q** I should be much obliged if you would help me out of a difficulty I am experiencing with my 6 h.p. twin-cylinder. I recently overhauled the engine, fitting new valve springs, etc., but when on the road the engine seems to misfire in one or both cylinders. The rocker arm is free, there is a good spark at the plugs, and the valves are free. The engine starts without an injection. The machine is fitted with a Binks three-jet carburetter. I should also like to know how to get airtight joints at the carburetter or induction pipe unions.—W.C.

You do not give us many clues as to the cause of your trouble. Of course, air leaks at the induction pipe unions

might be the cause, or it may be a partially choked jet. To make the unions airtight it should be noted that the joints fit accurately and are joined up tightly. To test for air leaks run the engine slowly in the garage, apply a little oil to the suspected joint, and if this is drawn in it will indicate the joint is not tight. To make it airtight you may wrap string soaked in oil at the back of the flange on the induction pipe or the whole union with insulating tape. To overhaul adjustment such as the magneto contact breaker, make sure the points are clean and separating .4 mm., see plugs are clean, and have a gap of about  $\frac{3}{32}$  in., and fit new valve springs.

**Magneto Lubrication.**

**Q** I should feel very much obliged if you would kindly inform me how and at what part I should oil my magneto. It is a Bosch, fitted to a 2½ h.p. New Imperial.

I have ridden the motor bicycle about 2,000 miles now, and it seems to me that it would be advisable to oil the magneto. I can, however, discover no oil hole. Does the armature-shaft, at the point where it gets its drive, receive any oil from the engine? But what of the other side of the shaft? Should any oil be applied to the contact breaker part of the magneto? I shall greatly appreciate your advice on my difficulty.—W.J.M.

If there are two lubricators—one for the contact breaker and one for the spindle—marked oil, you should put just a drop of engine oil in each about every 500 miles. If, as you state, there are no oil holes, you will know that the ball bearings are packed with grease, and are guaranteed to last for a considerable time. No oil is received from the engine. On no account put any oil on or near the contact breaker, otherwise it will affect the firing. Having ball bearings the magneto will run almost indefinitely without lubricating.

**READERS' REPLIES.****Flooding Carburetter.**

Having noticed a query regarding carburetter flooding by "F.R.H." in your issue of April 27th, I am writing to say I have had the same trouble, i.e., a leak under the jet, which I have cured by screwing up a nut under the jet. To avoid stripping the thread I should advise your correspondent to screw up until the dropping ceases, and no further.—E.S.

**Mysterious Pulling Up.**

In your issue of May 4th I note there is one of your correspondents somewhat puzzled as to what he terms a mysterious pulling up of his 3½ h.p. three-speed motor cycle in Ceylon. I am of opinion that the pulling up of the cycle is due to the high altitude (6,000 feet), and the only way to overcome the difficulty will be to have an engine with larger valves.—W. J. DUNN.

**RECOMMENDED ROUTES.****LEEDS TO STOKE-ON-TRENT.—C.P.H.**

Leeds, Huddersfield, Slaithwaite, Delph, Oldham, Ashton, Hyde, Adlington, Macclesfield, Congleton, Tunstall, Burslem, Hanley, Stoke.

**LLANGOLLEN TO SLEDMERE.—T.W.C.**

Llangollen, Whitchurch, Nantwich, Crewe, Sandbach, Congleton, Bakewell, Buxton, Chesterfield, Worksop, Doncaster, Selby, York, Stamford Bridge, Fridaythorpe, Sledmere.

**DUNSTABLE TO BOURNEMOUTH.—J.S.**

Dunstable, Tring, Chesham, Amersham, Beaconsfield, Slough, Windsor, Egham, Bagshot, Basingstoke, Winchester, Romsey, Cadnam, Lyndhurst, Christchurch, Bournemouth. Distance, 120 miles approximately.

**BOURNEMOUTH TO REDDITCH.—A.K.S.**

Bournemouth, Baileygate, Blandford, Warminster, Westbury, Melksham, Chippenham, Malmesbury, Cirencester, Northleach, Stow-on-the-Wold, Evesham, Alcester, Crabb's Cross, Redditch. Approximately 139 miles.

**MALVERN TO EDINBURGH.—R.C.F.**

Malvern, Worcester, Kidderminster, Wellington, Whitchurch, Tarporley, Warrington, Wigan, Preston, Lancaster, Kendal, Penrith, Carlisle, Longtown, Langholm, Hawick, Galashiels, Stow, Edinburgh. Approximately 305 miles.

**GOLDER'S GREEN (LONDON) TO BRIGHTON.—S.M.S.**

Golder's Green, West End Lane, past West Hampstead Station into Cavendish Road, Wrentham Avenue, Bathurst Gardens, here turn left and go across Harrow Road, down Wood Lane to Shepherd's Bush, Hammersmith Broadway, over Hammersmith Bridge, down Castelnau Road to Barnes, over Barnes Common into Roehampton Lane, leading on to Putney Heath, where turn left and go through Kingston Vale to Kingston, then along Surbiton Parade until you meet a point where you strike the tramlines; here turn left and follow these, going straight on up the Brighton Road, and so via Leatherhead, Dorking, and Horsham.

TAKE CARE OF THE EGGS! A welcome lift to market.

Phone: Victoria 6553. One Minute Victoria Station.

In answering this advertisement it is desirable to mention "The Motor Cycle."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly, or mainly, of engineering or the production of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

# JUNO MOTOR CYCLES ARE THE VERY BEST

Sergt.-Major J. BENNETT, Upavon, Wilts, writes under date 28/3/16:

"I am pleased in every way with my **JUNO** motor. It has given me not the slightest trouble the whole twelve months I have run it, approximately 10,000 miles. The bearings are good as new, no shake anywhere, though the machine has done sidecar work for last eight months. It is and has always been the admiration of everyone who has seen and known it since I have had it."

This is only one of many testimonials as to the high quality of the "**JUNOS**."

**JUNO VILLIERS**, 2½ h.p., £29 10s., or £6 deposit and 41/8 month, or 12 equal monthly payments for the whole amount without deposit. 2-speed, £36, or £7 8s. deposit and 51/- month. V.T.S., £30 10s., or £6 4s. deposit and 43/- month. 2-speed, £37, or £7 10s. deposit and 52/- month. 4 h.p. J.A.P., £62 15s., or £16 deposit and 83/4 month. 6 h.p. J.A.P., £75 12s., or £16 10s. deposit and 105/- month. All carriage paid.

## SIDECARS.

**JUNO** Model A, £6 6s., or 11/8 month. "Modèle de Luxe, £12 12s., or 23/2 month. "Coach-built, £10 10s., or 19/3 month.

**WATSONIAN** Sidecars. All models stocked. Lowest prices for cash, or 12 equal monthly payments. Sent carriage paid.

Write for List or call. Largest Showrooms in City.

Everything for Motor Cyclists.

List free, 180 pp., which includes a most complete enumeration of Motor Cycle Accessories, Tyres, Belts, Clothing, Wind Screens, etc., at the very lowest prices. (See advt. in Miscellaneous Columns.) Any good make taken in part exchange for a **JUNO**.

## MOTOR CYCLES FOR SALE.

## Levis.

LEVIS, 1916, brand new, complete with 2 lamps, horn, and numbers; £31.—St. Tawa, St. Alban's Rd., Kingston-on-Thames. [X3076]

LEVISES.—All models from stock; deferred payments if desired.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [5669]

2½ h.p. Levis 1916 model, only once used, fully equipped with accessories; £32; guaranteed.—Wanchopes', 9, Shoe Lane, London. [X0320]

LEVIS Popular Model, new, but slightly shop-soiled; a special bargain, £24/17/6.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [5643]

LEVIS, 1915, 2½ h.p., mileage 1,000, carefully used, and in beautiful condition; £24;—seen after 8 p.m.—Penson, 36, Highbury New Park. [5858]

LEVIS, 1916. Popular models.—We are sole Oxfordshire agents, and can deliver correctly tuned Popular models at once.—Layton's Garage, Bicester, Oxon. [X0492]

LEVIS Popular, latest 1916 models, ex-actual stock; exchanges arranged.—Maudes' Motor Mart, 100 and 136, Gt. Portland St., London, W. Tel.: 552 Mayfair. [5887]

LEVIS Popular, 1915, excellent condition, new Dunlop tyres, P. and H. lamps, and all accessories; trial by appointment; £22.—Hudson, 22, George St., Richmond, Surrey. [5837]

LEVIS 2-stroke Motor Cycles, latest 1916 models.—Sole London and district agents. Cars and Motor Sundries, Ltd., 175-177, Shaftesbury Av., London, W.C. 'Phone: 1432 Regent. [0711]

## Martin.

MARTIN J.A.P., latest 1916 models, delivery from stock; single gear £32/10, if fitted with the famous Enfield 2-speed countershaft gear, £37/10.—Sole London and District Agents, Cars and Motor Sundries, Ltd., 175-177, Shaftesbury Av., W.M. Tel.: Regent 1432. [0760]

## Matchless.

6 h.p. 1912 Matchless-Jap, 2-speed, sidecar; £35.—Langton, 19, London Rd., Ipswich. [5756]

MATCHLESS, 8 h.p., 2-speed, and coachbuilt sidecar, new condition; £35.—Marston, 26 and 31, Bridge St., Chester. [X0306]

MATCHLESS, 1913, 8 h.p., Canoelet sidecar, hood, screen, Pillion, complete accessories, excellent condition; £55, cost £110.—Tubby, Outlook, Park Hill, Loughston. [5790]

MATCHLESS (Oct., 1913), 6 h.p., 2-speed, clutch, Canoelet sidecar, lamps, Cowey speedometer, etc.; not been much used; £48.—Kendall, 5, Wood St., Stratford-on-Avon. [X0396]

1912 Matchless-Jap, 6 h.p., 2-speed, wicker sidecar, and screen, P. and H. lamp, all tyres and belt nearly new, all in excellent condition; £45.—After 6 p.m., 2, Buckingham Mews, Buckingham Gate. [5778]

1913 Matchless, 6 h.p. J.A.P., 2-speed, clutch, kick start, tradesman's delivery body, also luxurious cane sidecar, absolutely perfect; £35 for immediate cash.—3, The Mews, Victoria Rd., Northside, Clapham Common. [5659]

MATCHLESS, 1914, 8 h.p. M.A.G. engine, 3 speeds, fitted with Collier's special sidecar and Lucas dynamo lighting outfit with 3 lamps, Watford speedometer, excellent order; £82.—Maudes' Motor Mart, 100 and 136, Gt. Portland St., London, W. Tel.: 552 Mayfair. [5884]

MATCHLESS Late 1914 8B Combination, clutch, chain drive, perfect order throughout, 2 Palmer Cord tyres, 1 Avon, complete lighting set, speedometer, 2 horns, wind screen, everything perfect; £70, or near offer; seen any time; trial run by appointment.—97, Camden Mews, Camden Sq., N.W. [5801]

8 h.p. Matchless Model B. 1915 Model Combination, machine and sidecar complete, with speedometer, and all accessories, folding carrier, beautifully upholstered sidecar, elaborate finish, 3-speed countershaft gear, free engine, and chain drive; £87/10; guaranteed.—Wanchopes', 9, Shoe Lane, London. [X0331]

1914 Matchless, with Swan sidecar, M.A.B. engine, 3-speed gear box, clutch, kick starter, P. and H. head lamp, horn, speedometer, tail lamp, etc., lot in splendid order; 68 gns.; exchange entertained with 1914 or later Triumph or Douglas.—Cambridge Garage, Francis St., Woolwich. 'Phone: 108 Woolwich. [5866]

1915 Matchless Combination, M.A.G. engine, 3-speed gear box, clutch, kick starter, Lucas head lamp, electric sidecar lamp, tail lamp, horn, speedometer, just thoroughly overhauled, looks and runs like new; £75; exchange entertained with 1914 or later Triumph or Douglas.—Cambridge Garage, Francis St., Woolwich. 'Phone: 108 Woolwich. [5866]

## Minerva.

MINERVA-LUGTON, 2½ h.p., mag., good tyres, all accessories; £14.—Scraser, 234, Battersea Park Rd., S.W. [5783]

MINERVA, 3½ h.p., and sidecar, B.S.A. frame, B. and B., and 11a. Whittle belt, good condition; £12.—69, Belgrave Rd., Walthamstow, E. [5703]

MINERVA, 3½ h.p., Bosch mag., in splendid condition throughout, including enamel and plate; £13/13.—Egbert Spearman, Bishop's Stortford. [5606]

## Petrol Waste.

**A**LL our readers must be familiar with the poster, "Don't use your motor for pleasure," and with others of the same class, the object, of course, being to curtail the use, and consequently the importation, of petrol. There are, however, better ways of achieving this object, and we hope that the Petrol Committee will evolve a plan that is at once effective and fair. Private motorists are well aware that the needs of the nation must claim priority, and they are quite content to subordinate their needs to the general good. As a correspondent points out, the proposed motor taxes tend to increase the use of individual motors (while they will certainly decrease the number on the road), because a man, having paid an exorbitant tax, will naturally wish to use his machine as much as possible in order to justify his expenditure in taxation, which is the same for a yearly distance of 1,000 miles as for an aggregate of twenty times that amount. It seems to us that an increased tax on petrol would be a far better method of attaining the end in view, viz., the economy of motor spirit. A man, who previously has been just able to afford a weekly run of 100 miles or so, would then not be obliged to lay up his machine, with a loss of healthy recreation to himself and revenue to the country, but would simply have to reduce his mileage, and instead of spending all day awheel could run out to a convenient spot and spend the day in the open air exploring the woods and commons and regaling himself with an *al fresco* lunch by the roadside. Thus his consumption of petrol would be reduced, but this would entail no real hardship. Apparently motor chars-à-bancs are not docked of their petrol supplies in any way, even when employed simply on pleasure jaunts; why then should others be interfered with who spend no more upon their week-end outing but prefer to spend their money in a different way?

While on the subject of petrol economy there is one other matter which seems to clamour for

an explanation. Every week large numbers of Government lorries are constructed in the Midlands and Lancashire: these are run up to London *empty*, using petrol at the rate of about six miles per gallon; and all the time the railways are congested with goods for the same destination, though possibly for a different Government department. Why should not some arrangement be made by which these lorries could run *loaded*, and thus do useful work from the very commencement of their career? Then again, there are more routes than one from Lancashire to London, and it seems to us a mistake to send all the lorries by the same route and damage the road surface beyond hope. Motor 'buses, too, consume large quantities of petrol, and while we admit that in many cases they serve a useful and necessary purpose, in others they certainly do not. Last Sunday some 300 motor 'buses visited the village of Chigwell, and it is stated that the scenes in the public houses just outside the London area on Sunday morning were most unseemly. Nearly 2,000 gallons of petrol must have been used on these trips, while the damage to the roads (to which the motor 'buses contribute nothing) is so great that the Epping Rural District Council has decided to send a deputation to the Local Government Board with the object of urging that the use of motor 'buses on the country roads, especially on Sundays, should be restricted. A simple calculation shows that this amount of petrol would have sufficed to carry ten despatch riders, travelling, say, ninety miles to the gallon, nearly fifty miles a day each for an entire year. Last week's *Punch* supplies us with an appropriate quotation:

"Well, I have read about some other grumblers

With curious similarity of soul,

Who left untouched the gnats that thronged their tumblers,

But drank their camels whole."

We commend these lines to the National Organising Committee for War Savings.

# Occasional Comments by "Ixion"

## A Simple Starting Wrinkle.

If any readers have machines which start without injection, but are a trifle stiff at the first push, the following tip may interest them. A machine is easiest to push with a high gear engaged, but easiest to mount on a low gear. Therefore break the oil films by pushing it out of garage on a high gear; and then paddle it off, seated astraddle, on a low gear—second rather than bottom. This is the quickest and least laborious method of starting most multi-speed machines.

## Some Back Springing Details.

Of course, we are still a gigantic distance from standardisation of rear-springing; indeed, a few makers of the stick-in-the-mud order have not even got far enough to start thinking about it. But I want to make a present of two scraps of information to these conscientious objectors, when at last they join up. When you at last follow the crowd and adopt rear-springing, you may either plate your springs, or enamel them. Plating looks very nice when it is new, but if you want to find buyers for a big output, don't copy the blunder some designers have perpetrated, and add any more unnecessary plating to the standard machine; goodness knows, it carries more than enough of it already. Secondly, when you put your brains merchant on to the job of designing your rear springs, he will probably make some learned remarks about the cantilever system, which—as you will, of course, be aware—is an inverted semi-elliptic. A simple sum in arithmetic will remind you that a semi-elliptic is twice as big, heavy, and costly as a quarter-elliptic. You may be large-hearted enough to damn the expense, but may I timidly inform you that a quarter-elliptic, properly designed and made, will give your customers every bit as much comfort as the cantilever? That its adoption will save you a few shillings per machine, and, what is even more important, will reduce the number of working joints to be greased daily by your careless clients from six to two? Nuf sed, I hope.

## And then the Front Forks.

Common honesty compels me to add that when you adopt rear springing you will simultaneously want a new front fork, unless you are one of the clever or lucky few. In the past nobody thought of complaining if the front fork clashed a bit over bad bumps, or jangled its brake gear against the front down stem; in fact, we were largely ignorant of these happenings, because the jangle of the front brake was drowned by the medley of noises from a tinkle to a clatter, emanating from the contents of the rear panniers; and the rather frequent and violent clashes of the front fork represented the very poetry of motion when contrasted with the buck jumps of the tail of the machine. But when you get your rear springing dead right, you won't know your carrier is moving in the vertical plane, unless you watch its shadow out of the tail of your

eye; and you won't hear a sound from it, even if you strap a biscuit box containing a dumb-bell on it. So you will tardily awaken to the appalling crudity of your front fork (unless, as I say, you happen to be one of the few makers who have already evolved excellent front forks). Your fascinated gaze will be glued to its springs, and you will see them open and shut like the breach of a French 75 mm. gun doing a *rafale*, but with more violence and velocity; your outraged ear will hear nothing but the rattle of the front brake rod against the steering head, and the metallic protest of all the twiddly bits composing the front fork; as it opens and closes ten times a second with a pressure of about 3 ton per square inch. Then you'll summon the brains merchant of your factory, and say, "While you're about it, think out a new front fork, too; silent, mind you! And don't let it clash!" So you may just as well specify new front springing when you pass the word for the back springs.

## One Danger of Perfect Springing.

Every veteran rider knows the awkward swerve produced when either wheel strikes the steep edge of a smoothly hollowed rut at a very acute angle. It is not as bad as getting in register with a greasy tramline, but it is a fair imitation of that nightmare. Down goes the wheel to the bottom of the rut, and the other end of the machine is jerked sideways to suit. There is no danger about the matter for a rider who is alert and has his machine under control, but it may prove awkward if you happen to be putting on a glove or looking at your watch. Well, with rigid framed machines one is always warned that this possibility is about. A road which boasts this particular sort of rut makes its presence and character acutely felt up the vertebræ. But when you get on a perfectly sprung machine you don't know that the road is of this treacherous order unless you are keeping a keen look out; you are under no necessity to keep your track to an imaginary line along the centre of the camber, for it is long odds against your feeling the bumps if either wheel drops into them; the fore and aft springs can be trusted to rule the lot out. But there is an exception, as above stated. For example, if you are riding on the camber, and steering one-handed with a bit of a wobble, your front wheel may leave the camber and impinge on the steep side of the broad rut at an angle of about 1°. The machine won't give quite such a hop as a rigid frame would, but, as we all know, such ruts are often very deep, and you can hardly expect a spring fork not to protest faintly. As even spring-framed machines have not got a lateral hinge amidships, the steering is bound to be thrown out. Therefore, special care is advisable when riding spring frames on really bad roads until you are accustomed to them; the physical sensations do not give sufficient warning of the steering conditions to induce the necessary care and attention.

# WITH THE MUNITION WORKERS HILL-HUNTING IN LAKELAND.

Some Adventurous Climbs and a Remarkable New Hill.

By GEORGE D. ABRAHAM.

Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc.

A group of munition workers near the foot of the Stoneythwaite Rake. The group includes the successful riders in the hill-climbing expedition described in the following article.

**I**DEAL springtime weather and spring-time spirits marked the first munition workers' holiday on the Lakeland heights. If ever there was an occasion when pleasure motoring was justified in these warring times, surely this was one of them. Jaded workers from the whirring machine-shops of West Cumberland—where, especially in the aircraft section, work proceeds at fever heat night and day—came forth into the pure air and pure delight of trying their motor cycle mounts against the mountains.

The Vale of Duddon, truly the home of record hills, was the appointed scene of operations, and the little grey village of Seathwaite was the meeting-place. Surely the quiet dale has never seen such stir. Duddondale is notorious for its complicated roads, and from everywhere came the bark and roar of busy engines as we made our way towards Seathwaite. It was obviously to be a record gathering of its kind, and there were thrilling moments on the way. One was all eyes and ears at every meeting of the byways, for lost riders were hurrying to make up lost time. Some never arrived until evening when all was over.

The writer had come over from Kendal on a lusty A.J.S. sidecar outfit driven by Harry Whinnerah, a celebrated hill-hunting character in these northern dales. George Braithwaite, the expert competition rider of the peaceful, palmy days of trials galore, gave us the doubtful benefit of his dust. We followed his trail over Underbarrow, Gummershow, and Gawthorp Moor, and through Broughton-in-Furness to the sharp, right-hand turn up Duddondale at Duddon Bridge.

## Promise and Performance.

A great programme had been planned for the enthusiasts of the party, who

numbered over a score of "single-trackers" and nearly a dozen sidecars, but eventually it proved that only one sidecar driver had serious designs of joining in the sport. The plan was to climb the notoriously difficult Stoneythwaite Rake and make a circuit over the mountains back to Seathwaite by Birks Farm Hill. Then Walna Scar was to be attempted after lunch, and

Wrynose Pass crossed to Little Langdale as a grand finale. In the end, the Rake and Walna Scar, without the circuit, proved quite sufficient for a full day's sport, and one of the best withal. The large number of riders and their persistence of attack or determination not to admit defeat made the programme very long, but it was an altogether entertaining one for the spectators.

The A.J.S. sidecar driven by Harry Whinnerah, a one-armed expert, at the top of Walna Scar, 2,100 feet above sea level. This is the highest point in Lakeland reached by a sidecar.

### With the Munition Workers in Lakeland.—

At the outset the way to the Rake lay in a short return down the valley to the curious narrow Donnerdale Bridge over the Duddon. There we swung sharply round to the right, and were thankful that the crowd in front had left the many gates open. Those aloft had crossed the fields from Seathwaite. They especially are not likely to forget the wonderful sight up Wallabarrow Gorge on the way.

A carpet of bluebells led through the sweet-scented shades to the quaint stepping stones across the surging river, of which Wordsworth wrote so beautifully. Motorists who are passing over the main road at Seathwaite and are anxious to see the Rake at close quarters would be well advised to take this pleasant ten minutes' walk.

But with the munition men victimised by the hill-hunting fever, the Rake itself occupied all attention. There was much excitement as we approached the foot of the climb, and everybody was gazing skywards almost in the correct Zeppelin attitude. The attraction was soon obvious. Far above us the grey line of roadway curled out of the larchy underslope up to a gap in the skyline between huge purple precipices and a pale khaki-coloured speck of life was moving slowly aloft threading the perilous zigzag heights with a tiny white wisp of cloudlike smoke following its passage. It was George Braithwaite on his small Royal Ruby machine, the first man up the hill, and, as later events proved, the man to make the best and easiest ascent. The success of this small 2½ h.p. two-speed machine was the outstanding feature of the whole outing.

Doubtless, the skilful touch of an "old hand" was concerned in this, but on such steep, slippery, curly, and sliding slopes as the Rake the light machines seemed to make the best show. At the other extreme, a heavy 7 h.p. Indian, driven by J. G. Bethwaite, provided the excitement of the day, but of this more later.

### The Worst Hill in Lakeland.

This machine was the next to follow the Royal Ruby, but the initial terrific onslaught ended in "smoke" and then

silence. On our way up to the vantage point of the half-way bend for the purposes of photography, we passed the rider descending. The ascent on foot was extremely trying, for a breathless, thundery, warmth hung over the valleys and troubled the human engine as much as that of the petrol variety. Yet there was fair opportunity to corroborate a former opinion that, as a real road problem, the Rake must rank as the

Several of the ascents were thrilling for the spectators. Of the aircraft workers from the West, Stanley Bewsher made an exceptionally fine climb on his big, single-gear 8 h.p. Bat. Gilbert Brown restrained his 7 h.p. Indian splendidly, and his was the only foreign machine to reach the top. The pluck of J. G. Bethwaite on another 7 h.p. Indian was most astonishing; probably he frightened everybody except himself.

Time after time those up aloft heard the heavy roar of the engine, and finally the hero of many a despatch-riding adventure appeared round the bend close below. The powerful Indian was bucking and plunging like a wild cart-horse held in a leash. For an instant the rider forced it in the straight upward way. But the approach to the "hairpin" was refused. After a fearsome swerve, suddenly, and amidst a noisy, dusty uproar, machine and rider dashed off the road into mid-air. There was a startled cry from the spectators, a lucky click by the camera man, and everybody pressed to the rescue. The rider and machine had fallen seven or eight feet on to a soft bed of old bracken, which might almost have been placed there for their special reception. Yet it was a lucky escape. Three or four inches further and the rider's head would have struck the wall, and we should have rescued a less voluble being from under the heavy Indian. As it was, only a few bruises and some twisted details of the machine required attention.

### The only Sidecar Attempt.

Then J. Wilson, a Barrow rider, on a 3½ h.p. Rover, made a daring, if erratic, ascent. He certainly made every spectator

stand at a respectful distance from the margin of the road. Other enthusiasts almost reached the summit, notably a rider on a Rudge-Multi and another on a Rex-Jap, whilst Harry Whinnerah, on his A.J.S. sidecar, failed only with the goal in sight. The gear was obviously unsuitable. The drivers of other combination outfits evidently now deemed the climb hopeless; they made no attempt. The numerous spectators had some warm work assisting in the descent of the heavier machines, and some curious

A LUCKY SNAPSHOT ON THE RAKE.

The Indian jibs at the middle "hairpin" on a gradient of 1 in 3. The rider, J. G. Bethwaite, and the machine fell into the ditch!

worst hill in Lakeland. The "best" hill seemed the proper way of expressing it in these times, and one could not avoid thinking of a few years ago when hills of comparative simplicity were anathema. But now hill-hunting has become quite an obsession with sporting riders, and the best hill is one which cannot be climbed twice in succession without collapse. Such is the Stoneythwaite Rake, with its six difficult corners and stone-strewn gradients, where 1 in 3½ is the prevailing incline.

**With the Munition Workers in Lakeland.**— devices were employed. For instance, the careful tyro who, to act as a drag-brake, tied a big piece of the mountain to his spare belt would have found a borrowed rope less extravagant in these days of War Savings Committee warnings.

#### Climbing Walna Scar.

After refreshment at the New Field Inn—which, under its new management and with its fascinating surroundings, motor wanderers would do well to remember—an attack was made on Walna Scar. A year ago Stanley Bewsher had piloted his 8 h.p. Bat to the summit, and he

seemed anxious that others should now enjoy the experience. Few volunteered, but those who succeeded were more than satisfied. The main features of the Walna Scar Pass, which leads over the mountain from Duddon Valley to Conistoun, were its length, continuous steepness, and lack of spectacular situations. Thus the lookers-on found the climb dull after the excitement of the Rake, and very few walked even half-way up. Still it was a fine sight to watch the plucky riders dash up the lower rocky bends, then for a time disappear, to emerge again high up on the great mountain wall more than a thousand feet overhead. J. G. Bethwaite, on the big Indian,

again was first man away, and but for halts to open the gates he might easily have made a non-stop climb. Unfortunately, he had trouble in restarting on the steep and slippery slopes, and George Braithwaite on his irrepressible Royal Ruby passed by. He was first to taste the fresh cool breezes on the crest of the Scar, whilst those below were "hot beyond words." His was the only non-stop run; all the others who succeeded had to be "dug out" of a slate refuse heap, which seemed to have wandered on the steep road about half-way up the climb. This obstacle became worse after numerous riders had plunged into it, scattering fragments broadcast over the mountain side and spectators as well. There was general acclamation when J. G. Bethwaite rushed the lower bends on his racing Indian, and still more satisfaction when word came from the heights that he had reached the summit, despite another quarrel with the available width of the road. The springing of the Indian added to the unsuitability of the big machine for the work in hand, and Bethwaite would assuredly have had a less boisterous time had he brought his despatch rider's mount instead.

#### A Fine Performance.

Amongst others to reach the top were Don Dyson on a 6 h.p. Rex-Jap with

(Top) Climbing Walna Scar above Duddondale, a remarkable new hill first climbed by the munition workers. The road is grassy and steep, and ascends for two miles to over two thousand feet above the sea.

(Centre) A group of machines climbing the grassy road up Walna Scar.

(Left) The A.J.S. sidecar climbing the Rake on a gradient of 1 in 3.

three speeds, Gilbert Brown on a big two-speed Indian, and J. Wilson on a 3½ h.p. Rover. The successful ascent by Harry Whinnerah on the 6 h.p. A.J.S. standard sidecar machine was a meritorious performance, and one that is likely to rank as a record for a considerable time. It needs some familiarity with precipices close at hand, or at wheel, to drive a two-tracked machine for half a mile with one tyre two or three inches from the edge of nothing. This refers to the upper part of the Walna Scar road, which was in reality only a narrow, upward slanting slit cut across the mountain. But the danger was more apparent than real on a day following many others of continual dry-

With the Munition Workers in Lakeland.—ness. Under damp conditions the climb would be impossible.

Such were the writer's impressions as he clung to any available hold on the A.J.S. behind the plucky driver who, despite the physical loss, can do more, with one arm than most men with two. Our worst trouble was in "Slate Tip Gulley," as someone named the half-way obstacle. Our mighty dash into the sliding mass flung the machine and its load broadside off the track into a grassy hummock, where part of the frame became embedded. Another attempt at

slower speed and kind help from some "hefty" munitioners landed us on to the grassy slopes which finally led to victory. This climb to a height of 2,100 feet above sea-level will rank as the highest point yet reached by a sidecar in the Lake District.

#### Homeward Bound.

There was just time ere the descent was begun to note the wonderful view of Scawfell and the loftiest of our English mountains, which were gradually being blotted out by an oncoming thunderstorm. Had it arrived an hour

sooner the descent would have been a desperate undertaking, but the rain did not start until the valley was safely reached and the homeward journey begun. Thus ended the most successful gathering of its kind in the Lake District. It will certainly not be the last, and on a future occasion it is hoped to invite a party of despatch riders to join in the attack on some other famous hills. It is the very training they require, and the man who can pilot his machine over such heights as Walna Scar need fear no roads in France or on the rugged heights of Serbia.

## MILITARY NOTES.

News from the Punjab, France, Mesopotamia, and the North Sea.

#### MOTOR CYCLING IN THE PUNJAB.

A READER who is with his regiment at Sialkot, the Punjab, India, tells us that motor cycles are very numerous in that part of the world, especially Triumphs and Douglasses. Our correspondent rides an Indian, and he tells us that the roads thereabouts are excellent and he gets many fine rides at high speeds.

#### THE DESPATCH RIDER'S SALUTE.

THE following is an extract from "The Watch Dogs," the title of a letter from an officer at the Front, that is almost a weekly feature of *Punch*:

"Fortune favours the brave, and the lightning despatch rider, as often as not, will pass through the lot (lorries and cars) with the loss of little more than a couple of limbs and half-a-dozen spare parts. Even so, he will not omit to salute you, as you stand off the road—a sight which has a peculiar thrill of its own, since the salute of a motor cyclist consists in his looking fixedly in one direction and proceeding recklessly in another. You cannot help appreciating

his courtesy, but in your more nervous moments you can't help wishing he wouldn't do it."

#### MILITARY TWO-STROKES.

WE had a card a few days ago from Lt. F. L. Bassett, formerly of the Streatham and District M.C.C., and now with the Indian Expeditionary Force in Mesopotamia. The motor cycles out there are mainly Triumphs and Douglasses, but there are, Bassett tells us, some two-strokes. The roads are far worse than anything encountered in Scottish Six Days Trials, their condition immediately after rain being past description.

#### IN CHARGE OF A MOTOR PATROL BOAT.

WE had a call the other day from Lt. F. A. McNab, R.N.V.R., who is at present in command of a fast motor patrol boat somewhere in the North Sea. He had many interesting experiences to tell us, and saw a great deal more of the Lowestoft bombardment than he liked. The roads

round his dépôt are excellent, but he has had no opportunities lately for enjoying a ride on a motor bicycle. McNab confirms the reports concerning the popularity of *The Motor Cycle* among all stages of the Senior Service that we have heard from many parts of the world. Many fellow-officers in his mess are keen riders.

#### THE ACTIVE SERVICE PRESS.

RECENT references in these columns to papers published by soldiers for soldiers have resulted in two more being brought to our notice. These are *The Gasper*, "the unofficial organ of the 18th, 19th, 20th, and 21st (P.S.) Royal Fusiliers," and *The Sphinx*, the official organ of the 2nd/6th Batt. Manchester Regiment. Both have the advantage over some other war papers in that they are printed in England. A few are actually printed in the war zone, and this fact naturally adds to their interest.

*The Gasper* is edited in France by Pte. G. M. Green, who in peace days is a keen motor cyclist. *The Sphinx* is the best active service paper we have seen so far. There are twenty-four pages of matter to meet all tastes, and several good illustrations.

#### IMPROVING THE BREED.

DESPATCH riders' mounts in Macedonia are being severely tested by reason of the entire lack of good roads prevailing in that part of Europe. An R.E. sergeant, writing from Salonika, says that they have had thirteen frames, seven front forks, sixty fork springs, and many saddle springs broken already. These besides smaller items such as carriers and mudguards.

#### SIDECARS ON THE RIGHT.

A MATTER to which we have referred on more than one occasion is the fact that sidecar outfits intended for use in France are still sent out with the sidecars on the left. This is all very well for England, but over there, where the rule of the road is the opposite to that in England, it is altogether wrong. Cpl. H. A. Beard, in a recent letter, emphasises this point, stating that with the steep cambers prevailing on many roads in the war zone it is very dangerous at times. Why take so long to appreciate such a simple fact?

#### PEACEFUL MOMENTS BEHIND THE FIRING LINE.

The photographs were sent by Pte. E. Marsland, A.S.C., M.T., Staff Section. Marsland, who has been in France for over twelve months, was an observer in the 1914 A.C.U. Six Days' Trial.

## Foot Control of a Countershaft Gear.

Sturmev-Archer countershaft gear on a Triumph, altered so that the change of gear may be effected by foot instead of by hand.

**R**IDERS, and particularly British despatch riders on service, will be interested in the following suggestion for converting to foot control the usually hand-operated Sturmev-Archer countershaft gear lever fitted to the more recent models of the Triumph, as the need for retaining a firm hold of the handle-bars with both hands, when riding on the war-worn roads of France and other districts of military occupation, is of paramount importance.

Referring to the sketches, it will be seen that the operating lever is bent at two places, viz., at right

angles near the wooden grip knob and outwards at E, to clear the decompressor lever D. A flat face is cut on the wooden knob and studded with nails to prevent undue wear. The holes B and C, on which the lever is pivoted, are enlarged.

This idea is more particularly interesting as it comes to us from a French reader—a Quartermaster in a regiment of artillery on active service in the French firing line—and there is additional interest in the admirable illustrating sketches, made with the poor materials at hand, under war conditions.

## A COMEDY OF ERRORS.

Some Illusive Formula Figures Corrected.

**A** FORTNIGHT ago we stated that the only published figures (formula) of the hill-climb for public schoolboys contained two gross errors, perhaps more. Our contemporary retorted that the accuracy of these figures need not be doubted, and insinuated that, as we were not in possession of the details, criticism on our part was ridiculous. Now it is often possible to say that a statement is wrong, although, in the absence of necessary details, one might be unable to say what was correct. However, lest any of our readers might suppose that we have been indulging in wild guessing, let us examine the published results. The first thing that one notices is that the most powerful machines which made the slowest times have the best figures. Further, although we have not all the details, we have sufficient for our purpose.

In the case of Class VI. B, the Harley-Davidson has a capacity of 989, the time was 79 seconds, and the figure of merit ("the accuracy of which need not be doubted") is given as .1155. Thus  $\frac{C \times T^2}{W} = .1155$ , and

$$W = \frac{C \times T^2}{.1155} = \frac{989 \times 79^2}{.1155} = 53,440,000 \text{ lb.}!$$

Rather a

heavy machine and a remarkably hefty rider! (In fact, about the weight of a super-Dreadnought.) The second obvious error is in the same class, but if we turn to Class I. B we find the weight of the Baby

$$\text{Triumph and rider to be } \frac{C \times T^2}{.3545} = \frac{225 \times 65^2}{.3545} = 2.682,000$$

lb. This, again, is too high. In fact, every figure is wrong! If all the figures were incorrect in the same degree it would not matter, for they would still have served as a basis of comparison, but they are not. Apparently the weight has been multiplied in some cases by 10,000 and in others by 100,000—but why? There can be no adequate reason.

If the Baby Triumph and rider weigh 268 lb., the figure of merit should be 354. If the Harley-Davidson and rider weigh 534 lb., the figure should be 1155. The mistakes have arisen from an incorrect use of the decimal point, and are probably due to a paper attempting to deal with figures of a formula with which it is unfamiliar. Pioneers always have difficulties to contend with, and those who took part in getting out the formula results will doubtless have other things besides the drenching downpours to remember.

## A Further Selection of Letters from Readers scattered all over the World.

**O**UR endeavour to air the opinions of Overseas motor cyclists by publishing in the first issue of each month a selection of extracts from letters received from many Overseas readers bearing on the riding conditions, and so on, which exist abroad, has undoubtedly been much appreciated. We have already had quite a number of further communications expressing appreciation of the scheme.

Whereas in previous months our selections have been restricted chiefly to Australia and New Zealand, we are able this month to give extracts from India, Africa, and the West Indies, in addition to communications from the two previously mentioned countries. It is undoubtedly very difficult for manufacturers and riders over here to realise the difficulties under which motor cycling is carried on in these far-away parts of the earth. One of the greatest troubles is undoubtedly that of obtaining spare parts. This and the discontent caused by inflated Colonial prices for both machines and what spares are obtainable are certainly two sore points on which a very great number of our correspondents' letters bear.

After the war there will be undoubtedly great business to be done in the Dominions by the manufacturer who cares to study and remedy these two vital defects in his Overseas trading methods, in addition to studying the riding conditions in the countries where he is sending his machines and making them suitable for the conditions existing there, which in so many Overseas countries are totally different from those existing in England. Many makers are already alive to the position.

### Demand for Chain Drive.

Mr. W. J. GOUGH, Bowral, New South Wales: "The chain drive is in great demand here, and I think it is undoubtedly far better than the belt. My machine, which is a British-built 6 h.p. twin with chain drive, which I ride solo, is a most satisfactory one, but it is certainly a rather heavy mount for muddy or sandy roads. The chief trouble I have experienced has been due to broken control wires."

### English Machines Preferred.

Mr. W. SAUNDERS, Parramatta, New South Wales: "Australians, as a rule, prefer English goods, and we hope the war will soon be over and the English makers able to get down to 'biz' again, and make up for the time they have lost. A very large proportion of our motor cyclists, as well as very many prospective ones, are away at the Front, so when peace is declared the motor cycle business ought to boom out here."

### Motor Cycling Conditions in India.

"Phut-phut," Bombay, India: "The roads are, on the whole, good, but there are very few stretches where one can indulge in a real 'blind,' and nothing to touch the London-Birmingham or the Great North roads. I speak

of the Bombay side only, not being acquainted with the Calcutta, Madras, or Punjab districts. Dust is awful in the dry season, likewise mud in the rains. The Western Ghats provide us with some useful hills, but there is nothing worse than Kirkstone on the Thirlmere side, as they are all graded to 1 in 15, with very few exceptions, and present no difficulty except as regards many corners, their length, and the strings of bullock carts. The strings of carts, herds of cattle, and solitary carts (whose drivers are generally fast asleep) are the worst customers met with on the road.

"Practically all the machines are seen in the big stations, used by the civil and military alike, for running about the place. In big cantonments especially a motor bicycle is much handier and speedier than any other form of conveyance. There is no serious touring, and even among the owners of cars there is very little."

"Your motor cyclist out here is not the one you meet in England—not keen on it as a pastime, nor of the 'shamateur' type. He is almost always an amateur pure and simple, who must have some kind of conveyance."

"Up country, a man who knows anything at all about motoring soon collects a reputation, and in some cases I have known gets rather a thin time from his motoring friends."

"The price of British machines is not as outrageous as in New Zealand, but is, I think, in some cases higher than need be. Before the war a certain machine costing £50 in England was sold here for Rs. 950 (£63 6s. 8d.). I have made enquiries as to the cost of shipping one out here, and that particular machine would have absorbed £4 10s., and Customs duty would have been £2 10s., so I could have landed my motor bicycle for £57—a saving of about £6 on the agent's price."

"Second-hand motor bicycles always sell well, for there is the rich native, who is generally ready to plank down his money on the spot, and who does not care very much how much it is either."

### High-powered Machines Most Suitable.

Mr. J. O. JONES, Newcastle, New South Wales: "I consider that the higher-powered engines are the only ones that are really suitable for this country, even for solo work. A twelve or thirteen stone man should have for comfort at least 6 h.p. A good crank case ground clearance is necessary out here."

### Australian Assembled Machines.

Mr. F. BECKMAN, Grafton, New South Wales: "We out here are feeling the shortage of English machines, and, consequently, the Americans are making considerable headway with the sale of their machines in Australia. We now have several firms assembling their own machines, viz., Bennett and Barkell, Ltd., who fit J.A.P. engines; Healings, Ltd., Precision engines; and Bennett and Wood, who use M.A.G."

### Unpriced Machines and Spares.

Mr. H. E. TRAYLEN, Bombay, India: "Manufacturers should advertise their prices for all countries. Out here, if one asks for a price list of machines or spare parts it is supplied without prices. One is told when buying a machine that spare parts are obtainable. In 99% of cases parts cannot be had, except perhaps brake blocks. It is a known fact that the profit on foreign machines is greater than on British

## Overseas Opinions.—

machines. The foreigner is, therefore, rushed for all it is worth. One way of doing it is by putting the price of the British machine up. If only the manufacturer would insist that the retail prices are fixed he would gain a good return from one of the most excellent markets in the world (India). Although motor cycles are looked upon here as luxuries, the cost of upkeep is not really so very great. Petrol, for instance, is only one rupee (1s. 4d.) per gallon, recently raised 25%."

## Good Motoring Roads.

"G.H.," Hampstead, Jamaica, West Indies: "I have sold my old Indian motor cycle, and have ordered one of the latest three-speed Powerplus models. I am expecting it to arrive next week. Some of the roads hereabouts are simply ripping for motoring, and there are 'some' hills. Last year we went to a place called Mavis Bank. It is 4,500 feet up in the hills. In some places the road one has passed along can be seen winding three times below. It takes some nerve, as in several parts it is just a ledge cut in the face of the rock, with a sheer drop of 500 feet. The road is good, considering the fearful height. This year Jamaica has had a great number of American visitors. They could not get to Europe, so came here. Most of them brought motor cars, but there were a number of motor cycles and sidecars."

## Agents in India and the Ideal Machine.
